1.0 Introduction

This document presents a Baseline Ecological Risk Assessment (BERA) prepared for Project 1007 located in the east Twin Cities Metro Area of St. Paul, Minnesota. The BERA was completed as part of on-going investigations being conducted by AECOM for the Minnesota Pollution Control Agency (MPCA). The BERA has been prepared in accordance with the *Screening Level Ecological Risk Assessment and Baseline Ecological Risk Assessment Work Plan* (AECOM, 2020a), which was submitted to the MPCA in July 2020.

Project 1007 is a stormwater conveyance system that was constructed by the Valley Branch Watershed District (VBWD) in the east Twin Cities Metro Area to mitigate flooding in the landlocked sub-watershed of the Tri-Lakes area by lowering water levels in Lakes Jane, Olson, and De Montreville. The conveyance system includes a series of open channels, storm sewers, and existing surface water features that carries water out of the Tri-Lakes area, into Raleigh Creek at Tablyn Park, piped under Lake Elmo, and discharging to the east of Lake Elmo. Prior to Project 1007, Eagle Point Lake drained directly into Lake Elmo; however, now the water under most surface water elevation conditions is piped underneath Lake Elmo. There is direct discharge of Project 1007 to Lake Elmo via a secondary overflow structure. Combined surface water flow from the Project 1007 flow path and Lake Elmo then flows through Horseshoe Lake and a series of ponds and channels (West Lakeland Storage Area) before being piped to the St. Croix River.

Two historic PFAS disposal sites are located in the project area. The former Oakdale Disposal Site (ODS) is situated in a wetland area that drains to Raleigh Creek via both surface and groundwater and contributes to the transport of PFAS impacted surface water downstream. The Washington County Landfill (WCL) is located south of the Tri-Lakes Area and has historically discharged to Project 1007 upgradient of the confluence with Raleigh Creek via pipe from 1988 to 1995. This connection has been terminated but impacts could still be discharging to the surface water along the Project 1007 flow path.

PFAS are widespread in areas east of the ODS and the WCL and have been detected in many potable wells in the Project 1007 area. A baseline sampling event and subsequent seasonal and precipitation triggered sampling events have also identified detections of PFAS in surface water, sediment, and foam[1] within the aquatic habitats of the Project 1007 area. These sampling efforts are ongoing and include sediment investigations of wetland areas along Raleigh Creek and continued seasonal surface water sampling. A screening level ecological risk assessment (SLERA; AECOM, 2020a) identified the potential for risks to ecological receptors associated with PFAS exposure in these media and recommended further evaluation in a BERA. The focus of the BERA is to assess the potential for risks to ecological receptors exposed to PFAS in the aquatic habitats of Project 1007 and in aquatic habitats of connecting and adjacent waterways.

Figure 1 shows the extent of Project 1007 waterways located between the Tri-Lakes Area and the ODS to the west and the St. Croix River to the east.

[1] Foam has been observed in several locations throughout the Project 1007 waterways. PFAS analysis has indicated that the foam may contain elevated levels of PFAS relative to the surface water. Additional description of the foam is provided in Section 4.2.

1.1 SLERA Summary and Objectives of the BERA

The objective of this BERA is to identify key receptors, chemicals, media, and pathways that warrant risk management consideration for protection of the aquatic community and wildlife in the Project 1007 study area. If ecological risk drivers are demonstrated through the BERA process based on a reasonably robust site-specific dataset, cleanup goals will be established to facilitate stakeholder discussions regarding the need for a remedial action. Focused data gaps that come to light through this evaluation, such as the collection of specific tissue types not previously sampled, and the benefit of filling these data gaps, are discussed with regards to reducing uncertainty in the BERA conclusions.

A SLERA (AECOM, 2020a) was performed for the Project 1007 waterways using PFAS data from surface water, sediment, and foam samples collected as part of Project 1007 sampling efforts conducted between August 2019 and May 2020**.** The SLERA results indicated that additional study was required to evaluate the potential for ecological risks associated with exposure to PFAS in surface water, sediment, and foam. The presence of PFAS in surface water and sediment may result in bioaccumulation of PFAS in fish and other aquatic and semi-aquatic species that serve as prey items for birds and mammals foraging in the aquatic habitats. PFAS-containing foam may also be an exposure medium for some ecological receptors. The SLERA indicated PFAS exposures may pose a potential risk to some ecological receptors.

In particular, the SLERA identified exceedances of food web-based ecological screening values (ESVs) for wildlife and perfluorooctanesulfonic acid (PFOS) detected in surface water and sediment in multiple areas within the Project 1007 waterways. Less frequent exceedances were noted for direct toxicity-based PFOS ESVs for aquatic life (e.g., fish, invertebrates), and for perfluorooctanoic acid (PFOA) ESVs for wildlife. In addition, concentrations of PFOS were detected in foam at concentrations that may pose a risk to aquatic life exposed directly to the foam, although this pathway is considered uncertain given the short duration the foam is present and because it is not an aqueous medium. The SLERA retained PFOS and PFOA as constituents of potential ecological concern (COPECs) warranting further evaluation.

A BERA Work Plan (AECOM, 2020a) and Sampling and Analysis Plan (SAP; AECOM, 2020b) identified the data needs, sampling methods, and approach for conducting this BERA. The BERA methodology was provided in Section 6 of the SLERA and BERA Work Plan (AECOM, 2020a); any deviations and updates are captured in this document. A BERA field event was conducted in September 2020 by AECOM scientists to collect tissue samples and co-located abiotic media samples (i.e., surface water, sediment, porewater, foam) to provide site-specific information to support the BERA.

This document presents a BERA conducted using abiotic data collected during multiple sampling events in 2019 and 2020 and tissue data collected during the September 2020 BERA sampling event. The primary objective of the BERA is to evaluate whether or not populations of ecological receptors are potentially at risk due to exposure to PFAS present in environmental media within the Project 1007 waterways.

The study area considered in the BERA is described in Section 2. PFAS contamination in aquatic habitats may extend beyond the areas currently being evaluated in Project 1007 investigations. Additional evaluations may be conducted in the future based on the analysis of the data in the BERA.

1.1.1 Position of this BERA and Overall Ecological Risk Assessment

Ecological risk assessments (ERAs) evaluate levels of contaminants in various media (such as water, soil, sediment) to characterize the potential for adverse ecological effects on aquatic life or aquatic-dependent and terrestrial wildlife. As described above, they can be used to identify and characterize the current or potential threats to the environment, to evaluate the ecological impacts of various remediation strategies, and to establish clean-up levels. Data collected in support of an ERA can also be used to develop water quality standards, which set general goals for water quality to protect specific beneficial uses (such as drinking water, aquatic life, and aquatic consumption).

There are many challenges to conducting ERAs for PFAS. With over 5,000 known structures in the PFAS family, there simply is not toxicity, bioaccumulation, or biomagnification data for the vast majority of PFAS that may be found in the environment. Because data collection and risk assessment for these compounds are generally prioritized first towards human health rather than ecological health, the work done for this BERA represents a big leap forward in setting the foundation for a PFAS ERA. This study now provides a large amount of data helping to illustrate the presence of PFAS and the potential concern for ecological health. Ecological data and risk assessments are active areas of work in Minnesota and around the U.S.; therefore, this BERA represents a snapshot in time based on currently available information.

In general, PFOS has been the focus of most regulatory interest with less toxicity data available for other PFAS. At this time, there are little toxicity data available in the literature for most PFAS and there are no federal screening values that are considered widely accepted as benchmarks to judge the likely impacts of most PFAS to ecological health. For some PFAS, only single studies were available to derive the toxicity values used in the BERA. Water quality standards are usually derived to be protective of ecosystems/assemblages of wildlife and aquatic life, and are less centered on single species assessments unless they are deemed to be more sensitive and ecologically, economically, or socially/culturally important.

If the BERA identifies a risk driver based on the available information, it is reasonable to expect that the risk is “real” and there is concern for species within that particular feeding guild, if they are present and foraging as assumed in the BERA. However, the converse is not necessarily true, particularly for emerging contaminants like PFAS where the toxicological and bioaccumulative effects are not completely understood. If a risk is not demonstrated, it may be because the information is simply not available at this time to demonstrate the risk. As more information is gathered, more risks may be identified. As the scientific understanding of PFAS continues, future risk assessments or water quality standards may demonstrate more risks. This BERA demonstrates that even with the limitations discussed, PFAS have a clear potential for adverse ecological outcomes.

1.2 Ecological Risk Assessment Process

As discussed in the SLERA and BERA Work Plan (AECOM, 2020a), the ERA for Project 1007 is being conducted according to the general tiered approach and methodology provided by the United States Environmental Protection Agency (USEPA) (1997). Each successive tier of ERA requires more detailed and quantitative data analysis and interpretation. Conducting assessments in a tiered, stepwise manner allows the risk assessor and risk manager to maximize the use of available information and sampling data, while providing the opportunity to reduce the uncertainties inherent in the ERA process using focused supplemental data collection to fill key data gaps identified in the previous tier of the assessment, as necessary. In accordance with the USEPA guidance and process documents, the principal components of the ERA include:

- **Problem Formulation:** In this phase, the objectives of the ERA are defined, and a plan for characterizing and analyzing potential risks is determined. Available information regarding stressors and specific sites is integrated. Products generated through problem formulation include assessment endpoints and the ecological conceptual site model (CSM);
- **Risk Analysis:** During the risk analysis phase of work, data are evaluated to characterize potential ecological exposures and effects; and
- **Risk Characterization**: During risk characterization, exposure and stressor response profiles are integrated through risk estimation. Risk characterization also includes a summary of uncertainties, strengths, and weaknesses associated with the risk assessment.

These three components are conceptually sequential. However, the risk assessment process is frequently iterative, and new information brought forth during the risk characterization phase, for instance, may lead to a review of the problem formulation phase, or additional data collection and analysis.

The ERA follows the eight-step process for ERA outlined in *Ecological Risk Assessment Guidance for Superfund* (USEPA, 1997) (**Figure 2**). As each of the steps is completed, the results are evaluated and communicated by the risk assessors to the risk managers. Scientific Management Decision Points (SMDPs) occur at key points in the process and are used by the risk assessor and risk manager to determine if the process should continue, and if enough data have been evaluated to determine the outcome of the ERA.

Steps 1 through 5 of the ERA process (i.e., SLERA, BERA Problem Formulation, Study Design and Data Quality Objective Process, and Field Verification Design) were completed and presented in the SLERA and BERA Work Plan (AECOM, 2020a). These steps were completed in a stream-lined fashion because it was understood that the potential for risk to ecological receptors would not be eliminated via a simple screening level evaluation. The *Sampling and Analysis Plan for Baseline Ecological Risk Assessment Field Data Collection Efforts* (AECOM, 2020b) documented the sampling objectives, locations, and methodologies to be used in the BERA field sampling program.

This report documents the completion and results of Steps 6 through 8 of the ERA process outlined below:

Site Investigation and Data Analysis (BERA Field Program) (Step 6)

The Site Investigation and Data Analysis step of the BERA is the implementation of the BERA Work Plan in the BERA field sampling program. The outcome of the Step 6 field investigation is evaluated and presented in the BERA Report (Step 7). A SMDP is only needed in this step if there are changes to the BERA Work Plan. Ongoing interaction with MPCA has occurred through the field event planning and execution to ensure that the BERA is meeting the overall project objectives put forth in the BERA Work Plan; therefore, a separate SMDP is not necessary for this step.

Risk Characterization (Step 7)

Step 7, Risk Characterization, integrates data on exposure and effects to identify the potential for risk to ecological receptors. The outcome of Steps 6 and 7 are presented in this document, the BERA Report, which constitutes the SMDP for Step 7 of the ERA process, and the end of the formal ERA.

Risk Management (Step 8)

The final step in the ERA process is risk management. The BERA helps determine if a potential for actionable ecological risk is present and identifies a range of potential effects associated with potential PFAS exposures, as warranted.

1.3 Report Organization

The rest of this report is organized as follows:

- Section 2.0 provides an overview of the environmental setting, including a brief site history and a description of the biological and wildlife communities of concern in the study area.
- Section 3.0 identifies the datasets used in the BERA, including the 2020 BERA sampling event and other sources existing data.
- Section 4.0 provides a discussion of the detected levels of PFOS in the Project 1007 samples.
- Section 5.0 provides the problem formulation that includes the framework for the BERA and serves to define the risk assessment objectives and the geographic area to be considered. It also identifies the ecological receptors, exposure pathways, and assessment endpoints evaluated in the BERA.
- Section 6.0 presents the risk analysis of exposure and effects. This section considers the magnitude of exposure for identified ecological receptors and identifies the effects data used to assess the potential adverse effects associated with PFAS.
- Section 7.0 provides the risk characterization for each assessment endpoint identified in the BERA and discusses the uncertainties associated with the evaluation.
- Section 8.0 presents the overall findings and conclusions of the BERA.
- Section 9.0 provides a list of references cited in this report.

Appendices A through K provide various supporting documents, including detailed exposure concentration and dose calculations, analytical data reports, and laboratory reports.

2.0 Study Area Description

Project 1007 is located in Washington County, Minnesota and is a 14-mile conveyance system constructed in 1987 by the VBWD as a flood control project for the Tri-Lakes Area. Water is transported from the northwest part of the VBWD to the discharge point at the St. Croix River. PFAS has been detected in sediment, surface water, foam, and biological tissue samples collected from within the Project 1007 waterways and in several of the interconnected waterways adjacent to Project 1007. **Figure 1** presents the overall layout of the Project 1007 area.

2.1 Environmental Setting

The ecological setting within the vicinity of the Project 1007 waterways was initially characterized in the SLERA (AECOM, 2020a) using photographs and field observations from the August 2019 and February 2020 sampling events. This information was supplemented with resources from the United States Fish and Wildlife Service (USFWS) National Wetlands Inventory (NWI), Minnesota Department of Natural Resources (MNDNR), and aerial imagery. Potential habitats associated with the Project 1007 waterways are summarized below.

Project 1007 stormwater conveyance system spans from the Tri-Lakes area (Lakes DeMontreville, Olson, and Jane) in the northwest portion of the City of Lake Elmo and extends to the southeast through Lake Elmo, West Lakeland Township and Lakeland until ultimately discharging into the St. Croix River. The system is made up of dams, reinforced concrete stormwater pipes, HDPE pipes, drop pipes, weirs, and other appurtenances that help convey the surface water runoff from flood-prone areas in order to reduce flooding throughout the corridor and to improve the water quality of Lake Elmo. The conduit piping empties into creeks, ponds (retention and natural), and lakes as it passes through the length of the conveyance system. Multiple streams discharge into Project 1007 with Raleigh Creek being one of the largest. The headwaters of Raleigh Creek are a wetland area in the ODS and provides a surface water pathway for PFAS to enter Project 1007 at Tablyn Park.

While pipes and storm sewers do not represent habitat for ecological receptors, the Project 1007 surface waterways (wetlands, streams, creeks, channels, ponds and lakes) provide habitat for a variety of receptors. The following areas and habitats were the focus of the BERA sampling efforts and are the primary focus of the BERA:

- wetlands and the primary stream channel associated with Raleigh Creek;
- the lake habitats of Eagle Point Lake and Lake Elmo; and
- Horseshoe Lake and the stream and pond habitats of the West Lakeland Storage Sites (referred to in this BERA as the West Lakeland Area).

Flow in the Valley Branch Watershed moves through six lentic lakes including: Lake Jane, Lake, DeMontreville, Lake Olson, Eagle Point Lake, Lake Elmo, and Horseshoe Lake. The water depths range from 6 feet at Eagle Point Lake to 140 feet at Lake Elmo (VBWD, 2015). The lakes provide habitat to a range of freshwater fish species including largemouth bass, northern pike, sunfish, shiner, and carp (MNDNR, 2020d). In addition, Lake Elmo provides habitat to additional fish species such as tullibee (cisco), lake trout and rainbow trout. Lake Elmo is located partially within the Lake Elmo Park Reserve which contains approximately 1,732 acres set aside for preservation and includes forested upland, forested wetland, shallow marsh, and emergent wetland. State and federally threatened or endangered species potentially present within the study area are discussed in Section 2.2.

2.1.1 Project 1007 Headwaters and Raleigh Creek

At the headwaters of Project 1007 to the northwest of Lake Elmo are three smaller sized lakes (Lake Jane, Lake Olson, and Lake DeMontreville). These lakes are abutted by limited areas of shallow marsh. Water from these three lakes travels through a series of pipes to the confluence with Raleigh Creek at Tablyn Park. The pipe discharges to a channel with cattail vegetation which passes through a small pond before reaching Tablyn Park. The WCL did historically discharge the effluent of a remediation system designed to treat volatile organic compounds to this section of Project 1007 from 1988 to 1995.

The headwaters of Raleigh Creek, a small intermittent stream, begin just north of the ODS. Downstream of ODS there are several wetland areas which have flow year-round. A sediment investigation of these wetland areas is currently being completed to further understand the extent of PFAS impacts. These wetlands and connecting stream channels were observed to have crayfish, minnows, small bullheads (*Ameiurus* sp.), tadpoles, and green frogs (*Lithobates clamitans)*. Herons, swans, egrets, and other waterfowl are often observed feeding in these wetlands. After one of the wetland and pond areas, the flow passes through a culvert. This culvert, in addition to the larger storage capacity of the wetland, limits movement of water further downstream. Flow from Ideal Avenue to the confluence with Project 1007 at Tablyn Park is intermittent and is only observed during periods of frequent rainfall or snowmelt, limiting the influx of PFAS from Raleigh Creek into the downstream stretches of Project 1007. The intermittent section of Raleigh Creek was dry during the BERA sampling event.

The combined Raleigh Creek and Project 1007 downstream of the confluence typically contains flow all year and discharges into a wetland area at the inlet of Eagle Point Lake. The stream channel is erosional with a rocky bottom and undercut banks. Historical monitoring in Raleigh Creek included collection of benthic invertebrate community survey samples between 2003 and 2007 and visual observations of small fish species (e.g., shiners, sunfish, minnows) (VBWD, 2015). Sampling conducted to support the BERA found minnows, green sunfish (*Lepomis cyanellus*), red ear sunfish (*Lepomis microlophus)*, small bullheads, tadpoles, green frogs, and crayfish within the stream channel.

2.1.2 Eagle Point Lake and Lake Elmo

Raleigh Creek discharges into the northwest corner of Eagle Point Lake which is a larger wetland area before it broadens into the main lake. Eagle Point Lake is located completely within the Lake Elmo Park Reserve. It is primarily surrounded by wetland vegetation. This shallow lake has a maximum depth of about 9 feet and provides habitat for waterfowl and other wildlife. The depth of the lake has been observed to have fluctuations over the year (approximately 4 feet change in 2020), affecting the extent of water within the wetlands surrounding the lake. Carp and bullheads are the predominant fish species in the lake (VBWD, 2015) and bullhead, bluegill (*L. macrochirus*), black crappie (*Pomoxis nigromaculatus*), green sunfish, and largemouth bass (*Micropterus salmoides*) were collected during the BERA sampling event. Multiple snail and crayfish samples were also collected along the edges of the lake to support the BERA.

Water from Eagle Point Lake historically flowed directly into Lake Elmo, but the construction of Project 1007 diverted surface flow between an elevation of 894.0 feet (NGVD29 datum) and 896.5 feet into a 22-inch diameter bypass pipe which carries water from Eagle Point Lake along the bottom of Lake Elmo to a discharge point east of Lake Elmo Avenue (Primary Outlet Structure). When water levels in Eagle Point Lake rise above elevation 896.5 feet, water discharges directly into Lake Elmo (Secondary Outlet Structure). The Primary Outlet Structure was designed to divert approximately

90% of water from Eagle Point Lake through the bypass pipe and under Lake Elmo. During the summer of 2020, water was observed to discharge via the Secondary Outlet Structures after three periods of high rainfall. Besides the flow from the Secondary Outlet Structure, there are no other surface water inputs to Lake Elmo and the primary source is groundwater discharge.

Although the Primary Outlet Structure was designed to limit direct discharges to Lake Elmo from the Project 1007 waterways, PFAS has been detected in surface water, sediment and fish tissue in Lake Elmo and may be from Secondary Outlet Structure discharges or from groundwater discharges. Lake Elmo has a surface area of approximately 284 acres and a maximum depth of nearly 140 feet and currently has a do not eat fish consumption advisory for PFAS for all species, as well as consumption advice for mercury. The fishery in Lake Elmo is managed by the MNDNR and the lake has been historically stocked with walleye (*Sander vitreus*), tiger muskellunge (*Esox masquinongy*), rainbow trout (*Oncorhynchus mykiss*), lake trout (*Salvelinus namaycush*), and brown trout (*Salmo trutta*) (VBWD, 2015). In 2019 Lake Elmo was stocked with tiger muskellunge fingerlings (MNDNR, 2020d). Fish collected from within Lake Elmo during the BERA sampling event included bluegill tullibee (cisco) (*Coregonus artedi*), black crappie, northern pike (*E. lucius*), and largemouth bass.

2.1.3 West Lakeland Area to the St. Croix River

Water from the Lake Elmo outlet and the Eagle Point Lake bypass pipe discharge to the ditch downstream of the Lake Elmo outlet and flows to Horseshoe Lake predominantly through an adjacent golf course via ponds, streams, and pipes. Horseshoe Lake covers approximately 76 acres with a maximum depth of 13 feet and an average depth of 7 feet (VBWD, 2015). Both native and exotic aquatic macrophytes have been observed in the lake (VBWD, 2015). Shallow marsh and emergent wetlands are also present along the perimeter of Horseshoe Lake. Fish in the lake were last surveyed in 1993 with bluegill and black crappie each representing 45% of the species observed. Bluegill and largemouth bass were collected from within Horseshoe Lake during the BERA sampling event.

A discharge pipe followed by a channel transports water from the eastern shore of Horseshoe Lake toward three ponds associated with the West Lakeland Area: North Pond, Middle Pond, and South Pond. These ponds are connected by channels constructed as part of Project 1007. These ponds and streams include areas of open water and emergent wetlands. Portions of the West Lakeland Area have historically been dry but currently all remain saturated, although some fluctuate in size and the presence of aquatic life is dependent upon the duration of saturated conditions. Areas where water remains for long periods of time, such as the north storage site (North Pond), support the growth of submerged and emergent plants (VBWD, 2015). During the summer of 2020, South Pond was observed to be the largest and deepest of the three ponds at over 15 feet deep. Fish collected from within these ponds and channels during the BERA sampling event included multiple bluegill and largemouth bass, and one green sunfish.

Downstream of South Pond, the flow is often piped and the SLERA found that PFAS concentrations were much lower than in upstream locations. Therefore, the focus of the BERA sampling event and the BERA itself are on the aquatic and wetland habitats associated with Raleigh Creek, Eagle Point Lake, Lake Elmo, Horseshoe Lake, and the West Lakeland Area. The flow through the remainder of the Project 1007 waterway and additional waterbodies of interest are described below and considered qualitatively in the BERA.

Flow exits the southern end of South Pond through a Project 1007 channel that flows approximately 1,000 feet before being piped to the Minnesota Department of Transportation pipeline, which moves water under and along I-94. The pipeline discharges into the I-94 Rest Area Pond which covers

approximately 12 acres. This stormwater pond is the last basin before the runoff from Project 1007 enters storm sewers that directly discharge to the St. Croix River (VBWD, 2015). An outlet from the pond was constructed as part of Project 1007 and water is piped along the I-94 corridor to its discharge point at the St. Croix River. The St. Croix River is approximately 0.5 miles across at the discharge point and is a National Scenic River-Way. After the discharge point, the St. Croix River follows south for approximately 16 miles before its confluence with the Mississippi River.

2.1.4 Additional Areas of Investigation Outside the BERA Study Area

Lake Edith and Valley Creek are located south of I-94. Currently this stream and lake are not directly connected to the Project 1007 waterways, but the north branch of Valley Creek may have had a historical connection prior to the construction of Project 1007 via a series of wetlands. The south branch of Valley Creek is a trout stream as a result of groundwater discharge, including that from aquifers known to be impacted by PFAS further west. Lake Edith and the north branch of Valley Creek have had detections of PFAS but results from the south branch are pending. Lake Edith consists of a north basin connected by a narrow channel to a smaller south basin. The lake covers approximately 80 acres with a maximum depth of 38 feet (VBWD, 2015). A large wetland area (Metcalf Marsh) is located approximately 3/4 mile upstream (west) of Lake Edith. This marsh area is characterized by many springs, which contribute water to the marsh and wetland (VBWD, 2015).

Brown's Pond was included in the sampling of forage and predatory fish at the request of MPCA during the BERA field event because of public access and known human consumption of fish from this lake. It is approximately 20 acres and is located completely within Lake Elmo Park Reserve. Brown's Pond is predominantly groundwater fed and had PFAS detections. At the time of the BERA sampling event, the seasonal changes of PFAS in Brown's Pond were not well understood. Brown's Pond is in a buried bedrock valley which may be contributing PFAS impacted water from Lake Elmo south towards Brown's Pond.

Sunfish Lake is located northwest of Lake Elmo. It is approximately 50 acres with a mean depth of 5.2 feet and maximum depth of 13 feet (VBWD, 2015). Sunfish Lake is predominantly groundwater fed and has no surface water outlet. Located between the WCL and Lake Elmo, Sunfish Lake may be receiving PFAS impacted groundwater from the WCL. MNDNR does not have recent data on the fish species present in this lake and the fish population is thought to be limited because of severe winterkills. Waterfowl and a variety of animals have been observed in and around the lake by residents (VBWD, 2015). Continued surface water sampling is planned for Sunfish Lake during summer 2021.

Other nearby lakes and creeks included in the Project 1007 sampling were also screened for potential ecological risk. Streams that contribute to the main Project 1007 flow path are Farney Creek, which flows into Eagle Point Lake, and an unnamed ditch which flows into Raleigh Creek west of Tablyn Park. Goose Lake is located south of Eagle Point Lake and is occasionally pumped into Eagle Point Lake to prevent flooding. Similarly, Friedrich's Pond is located north of Eagle Point Lake and is occasionally pumped into a wetland area north of Eagle Point Lake that may connect to the main flow path during high water conditions. Park Pond, Margaret Lake, Legion's Pond, and Down's Lake were all sampled to determine if these were impacted via groundwater pathways. Additional samples were also collected from piped sections of the waterway which do not provide an ecological exposure.

2.2 Biological Resources within the Study Area

As described in Section 2.1, the Project 1007 waterways include a variety of aquatic habitats including streams, wetlands, and lakes with the final discharge point occurring in a large riverine system (St.

Croix River). Groups of commonly occurring ecological receptors include aquatic plants, water column invertebrates, benthic invertebrates, fish, amphibians and reptiles, and aquatic-dependent birds and mammals. Commonly occurring wildlife potentially present in the aquatic habitats of Project 1007 were identified using habitat type and species information published in the literature. This information was supported by resources available through the MNDNR and observations made during various Project 1007 sampling events. During the development of the SLERA, MNDNR (2020a,b,c) resources were queried to identify threatened and endangered species with the potential to occur within the vicinity of Project 1007. The MNDNR provided access to the confidential Natural Heritage Information System (NHIS) rare features data[2] in September 2021 (MNDNR, 2021c) and rare species observed within one-mile of the Project 1007 waterways were identified.

In addition, USFWS Information for Planning and Consultation (IPaC) was used to evaluate if any special status species or sensitive habitats were within the vicinity of Project 1007 (https://ecos.fws.gov/ipac/). This review did not identify any critical habitats within the area (USFWS, 2021), but did identify the potential presence of four mollusks, three insects, and one mammal with federal listings. Special status species listed by these sources are provided in **Table 1** and discussed below. It is expected that if a federally threatened species occurred within the study area, it would also be documented in the NHIS rare features review (MNDNR, 2021c). Migratory birds that may occur in the vicinity of Project 1007 are also identified in **Table 1**. These species may only be present for a short period of time but are protected under the Migratory Bird Treaty Act (MBTA) of 1918. The Minnesota Breeding Bird Atlas (Pfannmuller, et al. 2017) was also consulted to assess whether any special status birds were likely to or confirmed to breed within the study area.

2.2.1 Aquatic Plants, Water Column Invertebrates, Benthic Invertebrates

Plants and invertebrates form the basis of the food web and adverse effects on these communities could reduce the quantity and quality of food available to higher trophic-level organisms. Vegetation in wetlands and emergent aquatic plants within waterbodies provide cover and forage for lower trophic level receptors like amphibians, fish, and invertebrates and for birds and mammals. Aquatic vegetation within the study area includes native species like pipewort (*Eriocaulon* spp.) and Illinois pondweed (*Potamogeton illinoensis*) preferring clear water, and some undesirable non-native species like curlyleaf pondweed (*P. crispus*) and Eurasian watermilfoil (*Myriophyllum spicatum*). Pond lilies (*Nuphar* spp.) are also present in some ponds.

Cattails (*Typha* spp.) and tall grasses are present along the edges of Eagle Point Lake and several of the ponds, and along some stream channels. Other areas have undercut banks with overhanging shrubs or forested habitat along the shoreline. These undercut banks provide good shelter for fish and invertebrates.

The BERA sampling event was conducted in the fall so aquatic and emergent insects were not observed. However, it is expected that larval stages of semi-aquatic insects such as mayflies, dragonflies, damselflies, mosquitoes, midges are seasonally present. Aerial insects emerging from within the Project 1007 waterways likely provide a food source for bats and insectivorous birds like

[2] Natural Heritage Information System Rare Features Data. Copyright 2021, State of Minnesota, Department of Natural Resources. Rare features data included here were provided by the Division of Ecological and Water Resources, Minnesota Department of Natural Resources, and were current as of September 10, 2021. These data are not based on an exhaustive inventory of the state. The lack of data for any geographic area shall not be construed to mean that no significant features are present.

tree swallows. Other water column invertebrates include zooplankton and aquatic beetles and common benthic macroinvertebrates include a range of species such as freshwater snails and crustaceans.

Crayfish were present in most waterbodies during the BERA sampling event and snails were observed in Eagle Point Lake and Raleigh Creek. Mollusks were also observed within the ponds of the West Lakeland Area. These invertebrates are expected to represent prey items for birds such as herons and egrets and mammals such as raccoons (*Procyon lotor*), mink (*Neovison vison*) and otters (*Lontra canadensis*).

As shown in **Table 1**, multiple special status mollusks (including state and federally endangered; and state threatened and species of concern) are identified as potentially occurring within or near the Project 1007 waterways. These mollusks are expected to be found within the St. Croix River, rather than within the Project 1007 waterways themselves. The mollusk species are all most likely to inhabit large rivers and the few species that may also be found in smaller streams (i.e., elktoe [*Alasmidonta marginata*], round pigtoe [*Pleurobema sintoxia*], spike [*Eurynia dilatate*]) prefer swift currents with sand and gravel substrates (MNDNR, 2021f,g,h), which are present in very few portions of the study area. A few segments of Raleigh Creek may fit this description but only intermittently contain water and are shallow enough that they freeze completely in winter. Waterways within in the lotic portion of the remainder of the study area are slow-moving with a silty bottom and the remaining lentic portion would also not be expected to harbor these protected mollusk species due to lack of appropriate habitat.

Three special status insects, including the rusty patched bumble bee (*Bombus affinis*; federal endangered and on the state watchlist), the Karner blue butterfly (*Lycaeides melissa samuelis*; state and federally listed), and a species of jumping spider (*Pelegrina arizonensis*; state species of concern) were identified as potentially occurring within or near the Project 1007 waterways. The monarch butterfly (*Danaus plexippus*), a candidate species for federal listing, may also occur in the study area. The NHIS (MNDNR, 2021c) indicated that the last observations of the jumping spider were made more than 20 years ago[3] and there were no observations of the Karner blue butterfly within the study area. The two butterfly species and the rusty patched bumble bee are more likely to be found in open upland areas where native terrestrial plants are common, rather than in the aquatic habitats found in the study area.

2.2.2 Fish

In an aquatic environment, fish include those at the bottom of the food web (i.e., small herbivorous or filter feeding fish), mid-level forage fish (e.g., diet of invertebrates and small fish), to predatory fish (e.g., piscivorous fish). These fish, in turn, are an important part of the aquatic food web for higher trophic-level organisms (i.e., omnivorous and piscivorous birds and mammals).

Forage fish observed and sampled within the Project 1007 waterways included bluegill, fathead minnows (*Pimephales promelas*), golden shiner (*Notemigonus crysoleucas*), stickleback (*Culaea inconstans*), red ear sunfish, mudminnow (*Umbra limo*), green sunfish, darter (*Etheostoma* sp.), and crappie. Bluegill were the most frequently sampled forage fish during the BERA sampling event; although they were not observed in Raleigh Creek. Green sunfish were the most frequently observed forage fish in Raleigh Creek. Forage fish sizes ranged from small minnows and shiners (3 to 10

[3] The lack of an observation of a species within the last 20 years may be due to a lack of surveys in the area and does not necessarily indicate that the species is not present if the relevant habitat is still available.

centimeters [cm] long) in Raleigh Creek to larger (> 20 cm) crappie in Eagle Point Lake and Lake Elmo. The larger forage fish are expected to have an omnivorous diet that includes water column invertebrates, benthic invertebrates, fish eggs, minnows, zooplankton, and small amphibians.

Predator fish were observed and sampled within Eagle Point Lake, Lake Elmo, and the West Lakeland Area. Largemouth bass was the most frequently observed and sampled predator fish during the BERA sampling event with a smaller number of northern pike collected. Both of these species are highly piscivorous with a diet likely to include shiners, suckers, perch, bluegill, as well as benthic invertebrates and amphibians. The largest fish collected during the BERA sampling event was a northern pike in Lake Elmo nearly 80 cm long and weighing over 3 kilograms (kg). Although this sample was not retained for use in the BERA, it shows that the lakes support a fishery that includes large predators.

As shown in **Table 1**, six state fish of special status, two state threatened fish, and one state endangered fish (skipjack herring [*Alosa chrysochloris*]) were identified as potentially occurring within or near the Project 1007 waterways. Most of these fish are expected to be found within the St. Croix River, rather than within the Project 1007 waterways themselves. The least darter (*Etheostoma microperca*) and the pugnose shiner (*Notropis anogenus*) are the only species documented outside of the St. Croix River within one-mile of the Project 1007 waterways (MNDNR, 2021c).

2.2.3 Reptiles and Amphibians

The bottomland forest stands in the vicinity and the aquatic habitats within Project 1007 may provide habitat, such as damp leaf litter, moist crevices within trees, fallen trees or logs, submerged structures, banks, and/or aquatic water bodies, for reptiles and amphibians. Reptiles and amphibians such as turtles, frogs, and salamanders play an important role in the aquatic food web.

Tadpoles and adult green frogs (*Lithobates clamitans*) were observed and sampled during the BERA sampling event in September 2020. Green frog tadpoles feed mainly on diatoms and algae while the adults eat insects, worms, and occasionally smaller frogs and fish. Green frog eggs are laid in May through July. Most of the young overwinter as tadpoles and develop into frogs the next summer (MNDNR, 2021), so the presence of tadpoles in late September is not unexpected.

Other reptiles and amphibians that may occur in and near the Project 1007 waterways may include the blue-spotted salamander (*Ambystoma laterale*), tiger salamander (*Ambystoma tigrinum*), painted turtle (*Chrysemys picta*), spiny softshell turtle (*Apalone spinifera*), northern map turtle (*Graptemys geographica*), American toad (*Anaxyrus americanus*), gray treefrog (*Hyla versicolor*), northern leopard frog (*Lithobates pipiens*), western chorus frog (*Pseudacris maculata*), wood frog (*Lithobates sylvaticus*), prairie skink (*Plestiodon septentrionalis*), common garter snake (*Thamnophis sirtalis*), eastern hog-nosed snake (*Heterodon platyrhinos*), redbelly snake (*Storeria occipitomaculata*), western fox snake (*Pantherophis vulpinus)*, and snapping turtle (*Chelydra serpentine*).

As shown in **Table 1**, one state threatened reptile (Blanding's turtle [Emydoidea blandingii]) was identified as potentially occurring within or near the Project 1007 waterway. While this turtle was observed in multiple locations in the vicinity of the waterway, the NHIS (MNDNR, 2021c) indicated that the last observations of this turtle were made more than 20 years ago. However, since vegetated wetlands and streams occur within the study area, the Blanding's turtle could be present in and near the Project 1007 waterways.

2.2.4 Birds

The creeks, streams, ponds, wetlands, lakes, and river of Project 1007 offer foraging opportunities for various types of waterfowl, wading birds, shorebirds, and raptors. Commonly occurring aquatic-dependent birds potentially present in the Project 1007 waterways include the Canada goose (*Branta canadensis*), blue-winged teal (*Anas discors*), mallard (*Anas platyrhynchos*), ring-necked duck (*Aytha collaris*), wood duck (*Aix sponsa*), great blue heron (*Ardea herodias*), and spotted sandpipers (*Actitis macularius*).

Wading birds such as herons and egrets typically stand in shallow waters or walk through shoreline vegetation to hunt mobile prey such as fishes, frogs, and large invertebrates. These birds are expected to be directly exposed to sediment and may bioaccumulate PFAS from small fish, snails, crayfish, and amphibians. Ducks are expected to forage for aquatic plants and invertebrates, and insectivorous birds like the sandpiper will forage for invertebrates along the shoreline. Larger piscivorous birds like the bald eagle (*Haliaeetus leucocephalus*) or osprey (*Pandion haliaetus*) are expected to forage heavily on fish within the larger ponds and lakes. Terrestrial songbirds like tree swallows may be indirectly exposed to PFAS by ingesting aerial insects that bioaccumulated PFAS during their aquatic larval phase in the Project 1007 waterways.

As shown in **Table 1**, two state birds of special status (red-shouldered hawk [*Buteo lineatus*] and Forster's tern [*Sterna forsteri*]) may be present within the Project 1007 waterways; however, the hawk is expected to be found in deciduous forests more than in the waterways. The tern was only documented once in 1994 within one-mile of the Tri-Lakes Area so there is some uncertainty about whether this species may still be present in the area. Some species of migratory birds (e.g., black tern [*Chlidonias niger*], bald eagle [*Haliaeetus leucocephalus*]) may occupy wetlands or shorelines within the Project 1007 waterways during migratory stop-overs, while other migratory species identified on **Table 1** are more likely to be found in upland forests or meadows outside the study area (e.g., wood thrush [*Hylocichla mustelina*], black-billed cuckoo [*Coccyzus erythropthalmus*]).

Of the birds listed in **Table 1**, the Henslow's sparrow (*Ammodramus henslowii*) and the bald eagle are the only migratory species listed by the Minnesota Breeding Bird Atlas (Pfannmuller, et al. 2017) as having 'probable' or 'confirmed' evidence of breeding, respectively, within the study area. However, the Henslow's sparrow (which is also a state endangered bird but was not identified within one-mile of the study area in the NHIS review) is a ground-feeder that prefers upland habitats with open grasslands, especially weedy fields and meadows with terrestrial insects and seeds, over riparian and aquatic habitats. The Henslow's sparrow may have been sighted transiently within the study area, but it is unlikely this species would forage on the benthic and aquatic insects or plants in the waterways under evaluation in this BERA.

Although not identified as a protected migratory bird in the study area by the IPaC query, the Minnesota Breeding Bird Atlas (Pfannmuller, et al. 2017) does indicate that the osprey (*Pandion haliaetus*), a species protected under the MBTA, also has 'confirmed' evidence of breeding within the study area. Eagle nests are not currently known to be present within Lake Elmo Park Reserve (D. MacSwain, personal communication, September 22, 2021) but may be present in areas adjacent to the Project 1007 waterways. An osprey nest was observed near the outlet of Eagle Point Lake during Project 1007 sampling efforts.

Migratory birds passing through the study area may only be present for a short period of time and many resident birds are likely to migrate out of the area for the winter months.

2.2.5 Mammals

The creeks, streams, ponds, wetlands, lakes, and river of Project 1007 offer foraging opportunities for a variety of mammals. Commonly occurring aquatic-dependent mammalian species may include mink, muskrat (*Ondatra zibethicus*), beaver (*Castor canadensis*), river otter, raccoon, and little brown bat (*Myotis lucifugus*).

Herbivorous mammals like the muskrat are expected to consume primarily rooted aquatic plants within the waterways. Bats, like songbirds, may consume aquatic emergent flying insects with a larval phase in the Project 1007 waterways. Larger omnivorous mammals like raccoons are expected to forage in the wetlands, creeks, and along the shoreline of the ponds and lakes. The omnivorous mink may be present in larger perennial waterbodies and, like the raccoon, is expected to consume a mix of amphibians, fish, benthic and aquatic invertebrates, and plants, although mink consume much less plant material and are more carnivorous than the raccoon. The river otter is a piscivorous mammal that is likely to inhabit the larger waterbodies (e.g., larger ponds, Eagle Point Lake, Lake Elmo).

As shown in **Table 1**, no state listed mammalian species were identified as potentially occurring within or near the Project 1007 waterways. The northern long-eared bat (*M. septentrionalis*) is a federally threatened species that was identified in the IPaC review of the area, but the NHIS (MNDNR, 2021) did not identify this state species of concern within a mile of the Project 1007 waterways. In addition, MNDNR (2021b) did not identify winter hibernacula or maternal roost trees near the waterways. No maternal roost trees were identified within Washington County.

3.0 Data Considered in the BERA

The BERA considered surface water, surface sediment (0 to 6 inches below the sediment surface), and foam samples collected from within the Project 1007 waterways over a baseline sampling event and multiple seasonal sampling events between August 2019 and November 2020. These sampling events have been detailed in various Project 1007 memoranda (AECOM, 2019; AECOM 2020c) and are summarized in Section 3.1. In addition, a focused BERA sampling event was conducted in September 2020 which included the collection of surface water, surface sediment, porewater, and biological tissue samples. Details of the BERA sampling event are provided in Section 3.2.

Samples considered in the BERA were collected from the wetlands and aquatic habitats associated with Raleigh Creek, Eagle Point Lake, Lake Elmo, and the West Lakeland Area (which includes Horseshoe Lake and downstream ponds and connecting channels). **Table 2** identifies the PFAS constituents analyzed in each of the media considered in the BERA. **Appendix A** provides the analytical data for each sample included in the BERA. **Figures 3 and 4** present the sampling locations for abiotic and biotic samples considered in the BERA.

3.1 Baseline and Seasonal Sampling Events

An initial Baseline Sampling Event was completed in August 2019 (AECOM, 2019) which consisted of sampling surface water and, if possible, a co-located surface sediment sample (0 to 6 inches below the sediment surface) along the main Project 1007 flow path. Based on the results of this initial study and a further understanding of flow through the system, additional seasonal and event triggered sampling of surface water was completed during 2020. The event triggered sampling events that were conducted to assess PFAS concentrations during both high and low flow conditions as certain areas of the project area, especially Raleigh Creek, were observed to have larger fluctuations in flow throughout the year. This sampling also allowed for the assessment of how flow through the intermittent section of Raleigh Creek affected downstream PFAS concentrations. Additional sediment sampling was also completed during the spring and summer of 2020 to further determine the extent of impacts. Foam was also sampled during these events when observed. Additional lakes and streams outside of the Project 1007 flow path were also sampled as part of these sampling events to determine if nearby waterbodies were also impacted with PFAS. All samples were analyzed by a State approved laboratory.

3.2 BERA Sampling Event

The SLERA (AECOM, 2020a) identified the potential for risks to wildlife receptors consuming vegetation and prey items that bioaccumulated PFOS, and to a lesser extent PFOA. The potential for direct exposure risks to aquatic communities (e.g., water column and benthic invertebrates, fish) was also identified, but to a far lesser extent than the potential wildlife risks. To further evaluate and characterize the potential for risks to these receptors, co-located sampling of various biological tissues and abiotic media was conducted.

A BERA sampling event was conducted in September 2020 to collect biological tissues that could be used in food web modeling proposed in the BERA Work Plan (AECOM, 2020a). The sampling approach for the BERA field effort was described in the *Sampling and Analysis Plan for Baseline Ecological Risk Assessment Field Data Collection Efforts* (AECOM, 2020b). The sampling locations targeted for inclusion in the BERA were based on a review of the PFOS and PFOA concentrations in sediment considered in the SLERA. In sediment and surface water, PFOS was detected more

frequently and at higher concentrations than PFOA. In general, PFOA concentrations showing ESV exceedances in the SLERA also showed PFOS exceedances; therefore, selecting sampling locations based on the presence of PFOS was also expected to capture co-located PFOA concentrations.

The objective of the BERA field work was to fill key data gaps to support the evaluation of potential ecological risks associated with exposure to PFAS released into the surface water and sediment within the Project 1007 waterways. In particular, the primary objective of the sampling was to provide site-specific tissue data for inclusion in the food web models planned for Raleigh Creek, Eagle Point Lake, Lake Elmo, and the West Lakeland Area.

An additional objective of the sampling was to collect co-located abiotic media samples that could be used to support the development of Project 1007 waterway-specific uptake factors. These site-specific uptake factors are more appropriate for use within the Project 1007 waterways than literature values, as the capacity for bioaccumulation is highly dependent upon site conditions. These uptake factors can be used to estimate tissue concentrations for food web modeling in areas where site-specific tissues were not collected and can be used, if needed, to help calculate cleanup goals for ecological receptors.

Appendix B provides the September 2020 sampling event documentation including photographs of sampling areas, tables of field information for the tissue samples collected for analysis, and field forms completed at the sampling locations. **Appendix C** provide the data validation checklists for the analytical samples collected during the BERA sampling event.

Tissue types targeted for collection were primarily based on the prey items identified for inclusion in the BERA food web models for each area (i.e., crayfish, amphibians, forage fish, and predatory fish) with additional 'opportunistic' tissue samples included to provide further information about the distribution of PFAS in different tissue types (i.e., bottom-feeding fish, snails). Sampling was conducted in the fall (September 2020), so collection of aquatic invertebrates (i.e., larval stages of semi-aquatic insects such as mayflies, dragonflies, midges) was not feasible. Fish tissue sampling was conducted via electrofishing, gill nets, dip nets, and minnow traps. Crayfish were collected using crayfish traps baited with cat food, hot dogs, and chicken, electrofishing, and dip nets. Fish sampling was conducted under a scientific permit issued by the Minnesota Department of Natural Resources (MNDNR) (Permit Number 29804A). Snails, tadpoles, and adult frogs were collected by hand or using nets. Amphibians were collected under a special permit for research issued by the MNDNR (Permit Number 3033).

Sampling for crayfish, forage fish, and predatory fish was designed to collect at least eight individual samples of a particular tissue type within each particular area or habitat type to ensure a sufficiently robust dataset for the calculation of statistics, evaluation of risks, and development of uptake factor relationships. Sampling for amphibians was more limited because of permit restrictions but at least eight individuals were targeted for the Raleigh Creek area, as this area had the highest PFOS concentrations in water and sediment. Collection of amphibians was more limited elsewhere in the project area.

Biota tissue targeted for collection included: benthic invertebrates (crayfish), forage fish (bluegill), and predatory fish (largemouth bass). Based on lack of target species at all locations or abundance of non-target species at specific locations, additional biota tissue collected included: amphibians (green frog and unidentified tadpoles), bottom fish (bullhead), forage fish (black crappie, tullibee (cisco),

darter, fathead minnow, golden shiner, green sunfish, mudminnow, red ear sunfish, yellow perch [*Perca flavescens*][4]), and predatory fish (northern pike).

Tissue samples for amphibians, crayfish, bottom fish, forage fish, and predator fish all included whole body samples. These samples were analyzed as received by the laboratory (e.g., crayfish shells were not removed). Snails were removed from their shells prior to analysis as it was assumed that these hard shells would not be consumed by birds or mammals. If necessary to obtain sufficient mass, some tissue samples were composited, and sometimes included multiple species within the same feeding guild (i.e., forage fish). Composite samples are identified in **Appendix B**.

Forage fish and predatory fish were collected to support the BERA and to provide the MPCA with fillet tissue data for use in assessing potential human health risks. These fish were filleted in the field and analyzed as separate fillet and carcass samples (referred to as 'part' samples in the **Appendix B** tissue sampling tables). The weight of the fillets and remaining carcass from each fish was recorded in the field and a 'whole body' fish concentration was mathematically generated from the PFAS concentrations in the fillet and carcass. These calculated 'whole body' fish concentrations were then used to represent fish concentrations for use in the BERA. **Appendix A** provides the calculations for determining the 'whole body' fish concentrations from the fillet and carcass (part) data. Analytical PFAS results for the fillet samples collected has been provided to the MPCA (AECOM, 2021).

Abiotic samples collected during the BERA sampling event were collected in the vicinity of the biological samples. In some cases, multiple biological samples were associated with a single abiotic sample (e.g., multiple fish samples associated with a single surface water sample). Surface water was collected from mid-depth for samples associated with fish samples and from just above the sediment surface for samples associated with crayfish, snails, and amphibians. In the laboratory, surface water samples were analyzed for PFAS in filtered water (dissolved phase) and in unfiltered water (total).

Porewater samples were collected from approximately 6 inches below the sediment surface using a Henry push sampler (M.H.E Products) connected to a peristaltic pump. Water quality measurements were taken of the surface water directly above the sediment and during purging to ensure a porewater sample was being collected. These measurements are included in the field notes (**Appendix B**). In the laboratory, porewater samples were preferentially analyzed for dissolved phase PFAS. PFAS in total (unfiltered) water was analyzed when sufficient sample volume was available. Three locations were analyzed for PFAS in both dissolved phase and total porewater. Sediment samples were also collected from the top 6 inches with an auger; this horizon is expected to represent the most biologically active zone for most benthic receptors. An auger was selected over the use of a shovel to allow for uniform sampling throughout the entire depth interval.

Abiotic samples collected during the BERA sampling event were analyzed by ALS Environmental with Method PFC/537M and biological tissue data were analyzed by SGS AXYS with method MLA-110.

[4] Yellow perch were only collected in Brown's Pond which is outside the five exposure areas evaluated in the food web models. Fish data from this pond are discussed in Section 7.3.6.

3.3 Data Quality

Data quality was reviewed utilizing the MPCA Guidance for Perfluorochemicals Analysis (MPCA 2020a). MPCA uses the Laboratory Data Review Checklist to document data quality for each laboratory report. The Laboratory Data Review Checklists for the BERA sampling event are included in **Appendix C** and consist of a review of sample receipt conditions, calibration, field and laboratory blanks, surrogates (labeled analogs), matrix spike/ matrix spike duplicate percent recoveries and relative percent differences (RPDs), laboratory control sample / laboratory control sample duplicate (percent recoveries and RPDs and field precision. A similar data review process was also completed for baseline and seasonal data collection efforts.

As part of the data quality review process, validation qualifiers were assigned to the results indicating potential quality issues. The data qualifiers used during the data review consist of:

- J – estimated value (+/- indicate the direction of bias)
- UJ – the reporting limit is estimated
- B – the value was within 10 times the associated blank concentration and indicates a high bias
- R – the result is unusable.

Data qualifiers for non-detect results (i.e., U qualifier where the concentration is less than the laboratory reportable limit) were identified by the analytical laboratory.

The majority of estimated flags (J- and UJ) were due to sample receipt temperatures above the MPCA guidance of 6 °C and labeled analog recoveries outside the limits of 50% to 200% (predominantly J+ and UJ). For more difficult matrices, especially tissue samples, some of the results were rejected due to labeled analog recoveries (often for precursor PFAS constituents).

Blank qualifications (B qualifiers) were also more prevalent during the quality review of the tissue data. The B qualifier indicates a potential for high bias (or false positive) due to laboratory contamination.

Results qualified as estimated (J, J+, J-, or UJ) and B are useable; however, bias may be present in the data. The data quality review also found that there is uncertainty in the dataset due to severely low (less than 20%) labeled analog recoveries, and most of these uncertainties were due to difficulties during analysis of the tissue matrix.

Results with J or B qualifiers were used in the BERA as detected concentrations. If the value was flagged with U (identified by the laboratory as not detected) or UJ, the result was considered a non-detect value in the BERA.

3.4 Data Treatment

All analytical data were compiled and tabulated in a database for statistical analysis. Surface water, sediment, and foam data were collected between August 2019 and November 2020 under both the baseline sampling, seasonal sampling, event triggered, and BERA sampling programs. Porewater and tissue samples were only collected under the BERA sampling program in September 2020. Summary statistics were calculated by area for each sampled medium. Foam data were evaluated on a sample-by-sample basis so summary statistics were not calculated for foam.

Data for samples and their duplicates were averaged before summary statistics were calculated, such that a sample and its duplicate were treated as one sample for calculation of summary statistics

(including maximum detection and frequency of detection). Where both the sample and the duplicate were not detected, the resulting value was the average of the limit of detections (LODs). Where both the sample and the duplicate were detected, the resulting value was the average of the detected results. Where one of the pair was reported as not detected and the other was detected, the detected concentration was used.

USEPA's ProUCL Version 5.1 software (USEPA, 2016) was used to calculate the upper confidence limit (UCL) on the mean for each PFAS evaluated in the BERA. A sample size of at least eight is recommended for the calculation of UCLs; however, UCLs may be calculated on smaller datasets with acknowledgment of the higher level of uncertainty in these UCLs. When fewer than eight samples were available (e.g., tissues in some areas), the ProUCL exports and the associated data were reviewed to assess whether the UCL or the maximum detected concentration would be the most appropriate exposure point concentration (EPC) to use in the BERA for the particular analyte/medium/area combination.

The UCL can be used as an EPC to represent overall PFAS exposure for a receptor community (i.e., benthic invertebrates, aquatic invertebrates, fish, wildlife) within a particular area. EPCs were estimated within each medium for each PFAS evaluated in the BERA in order to evaluate the selected ecological exposure pathways and receptors. These EPCs account for the range of media concentrations that ecological receptors may encounter (rather than the maximum concentration considered in the SLERA and in initial media screens for lower trophic level receptors described in Section 6.1). The maximum detected concentration was used as the EPC if sufficient sample numbers were not available or if the dataset had too many non-detects to calculate a UCL.

BERA-specific data were collected from within Raleigh Creek, Eagle Point Lake, Lake Elmo, and the West Lakeland Area and these were the four areas planned for quantitative evaluation in the BERA. Following a review of the analytical data, Raleigh Creek was divided into two separate areas referred to as Raleigh Creek-Upper and Raleigh Creek-Other (**Figure 1**). Raleigh Creek-Upper extends from just downstream of the ODS to the confluence with Project 1007. PFAS concentrations in tissue and abiotic media from this portion of the creek were typically higher than elsewhere in the Project 1007 waterways. Raleigh Creek-Other includes the Project 1007 waterway from location RC16A downstream to the discharge into Eagle Point Lake. Therefore, data and statistics were compiled for a total of five areas (Raleigh Creek-Upper, Raleigh Creek-Other, Eagle Point Lake, Lake Elmo, and the West Lakeland Area) to quantitively evaluate in the BERA.

Data collected from outside of these five areas are also provided in **Appendix A**. These include samples collected from areas that are not representative of ecological habitat (e.g., manhole samples), samples from areas downstream of the South Pond of the West Lakeland Area that showed low concentrations of PFAS in the SLERA, and samples collected from additional waterbodies outside the linear Project 1007 waterway (e.g., Browns Pond). These data are discussed in the uncertainty section (Section 7.3).

4.0 Data Discussion

The data evaluated in the BERA were collected over multiple sampling events and a general summary of the nature and extent of PFAS in various media is provided within this section. The available data help to support the understanding of the CSM within the Project 1007 waterways.

4.1 Surface Water, Sediment, and Porewater

In the upper section of Raleigh Creek before the confluence with Project 1007, the PFAS concentrations are higher for the majority of the compounds analyzed in surface water, sediment, and porewater compared to those in other sampling areas. PFOS has consistently been measured with the highest concentration compared to other PFAS compounds, followed by PFOA, perfluorohexane sulfonic acid (PFHxS), perfluorobutanoic acid (PFBA), and other shorter chain compounds. **Figure 5** provides boxplots showing the range of PFOS concentrations in surface water, sediment, and porewater throughout the BERA exposure areas and these results are discussed in the sub-sections below.

4.1.1 Raleigh Creek

Raleigh Creek exits the ODS via a culvert under Hadley Avenue into a wetland area with PFOS concentrations in total (unfiltered) surface water ranging from 1.5 to 8.8 micrograms per liter (µg/L). The surface water concentrations generally decrease in concentration as additional inputs flow into Raleigh Creek from stormwater detention ponds and other smaller unnamed creeks. Upstream of Ideal Avenue, Raleigh Creek flows through two ponds and a wetland area with dispersed flow before reaching the culvert underneath Ideal Avenue. To prevent downstream flooding, the culverts were set above the wetland elevation, effectively creating an elevation control structure. As a result, flow downstream is intermittent, and Raleigh Creek is only connected to the remainder of Project 1007 in the spring after snow melt and after rain events. The PFOS concentrations in total surface water in Raleigh Creek that enters Project 1007 (sampled at RC12) was measured from 1.1 to 2.1 µg/L.

The PFAS concentrations in the sediment in this area were also generally higher compared to other sections of the Project 1007 corridor, especially in the wetland areas. The longer chain PFAS compounds like PFOS, PFHxS, and PFOA have been previously found to adsorb more to sediment with higher organic content (ITRC, 2020). That trend was observed in this area as a high correlation was found between total organic carbon and PFAS concentrations. The highest PFOS concentration was measured slightly off the main channel at 1,610 micrograms per kilogram (µg/kg) in the wetland directly downstream of the discharge from the ODS. While significantly lower, PFOS concentrations greater than 100 µg/kg were consistently measured in other wetland areas further downstream, including in the ponds and wetlands immediately upstream of the Ideal Avenue culverts. PFOS concentrations were significantly lower in non-wetland stream stretches where flow is more erosional, ranging from 2.9 to 19.6 µg/kg. PFOA, PFHxS, perfluorooctane sulfonamide (PFOSA), and ethylperfluorooctane sulfonamidoacetic acid (N-EtFOSAA) were also consistently detected in the wetland sediment in the upper Raleigh Creek area. Shorter chain compounds, such as PFBA and perfluorobutanesulfonic acid (PFBS), were detected but at lower concentrations.

Porewater was only measured during the BERA sampling event which occurred in September when surface water concentrations of PFAS were lower than earlier in the year. Relative to the other detected PFAS, PFOS in Raleigh Creek was consistently measured at the highest concentrations in the dissolved porewater samples (ranging up to 2.1 µg/L), while PFOA and PFBA were reported at approximately half of the concentrations of PFOS in the same samples.

The samples collected from Project 1007 both upstream and downstream of the confluence with Raleigh Creek at Tablyn Park were grouped as Raleigh Creek-Other for the BERA to distinguish them from the Raleigh Creek samples collected closer to the ODS (Raleigh Creek-Upper). The surface water in Project 1007 from the Tri-Lakes Area has consistent PFAS concentrations that are approximately four orders of magnitude less than what is typically detected in Raleigh Creek-Upper. Surface water concentrations downstream of the confluence vary depending on the flow contribution from Raleigh Creek, with PFOS concentrations in total surface water ranging from 0.0017 to 1.23 µg/L. This segment of Raleigh Creek does consistently have flow during the growing season but has been observed to completely freeze during the winter.

Sediment concentrations downstream of the confluence between Raleigh Creek and Project 1007 are greater than those from Project 1007 upstream of the confluence but still lower than those observed in Raleigh Creek-Upper. Much of this stream segment is erosional with a rocky and sandy bottom (likely low organic carbon content). In addition to PFOS, PFOA, PFOSA, and PFBA were consistently detected. Porewater was also significantly lower in Raleigh Creek-Other compared to the upstream segment of Raleigh Creek.

4.1.2 Eagle Point Lake, Lake Elmo, and the West Lakeland Area

Raleigh Creek flows into the northwest corner of Eagle Point Lake through a wetland area. When Raleigh Creek is flowing into the confluence with Project 1007, Eagle Point Lake receives surface water inputs with high PFAS concentrations; however, input concentrations are lower when Raleigh Creek is not actively flowing. The surface water concentrations of PFAS are consistent throughout the entire lake although there may be some slight seasonal variations depending on the extent to which the upper portion of Raleigh Creek is or is not connected to Project 1007.

Sediment concentrations in Eagle Point Lake were elevated compared to the segment of Raleigh Creek directly upgradient and were similar to those measured in Raleigh Creek-Upper (**Figure 5**). Eagle Point allows for sediment that may contain PFAS to settle out and the lake sediment was found to have high total organic carbon concentrations which could increase sorption of PFAS to the lake sediment. The varying concentrations of PFOS, PFOA, PFHxS, and PFBA at different sediment sampling locations within Eagle Point Lake were found to correlate with total organic carbon concentrations. PFAS concentrations in Eagle Point Lake porewater were also elevated compared to Raleigh Creek-Other, but lower than concentrations in Raleigh Creek-Upper.

Lake Elmo has lower concentrations of PFOS, PFOA, and other long chain PFAS, but PFBA and other short chain compounds were found to be at higher concentrations in Lake Elmo surface water and sediment relative to Eagle Point Lake. This increase could be a result of a groundwater plume discharging into Lake Elmo that has a different PFAS composition than that in the surface water discharge from the ODS. Sediment PFOS concentrations were similar to concentrations in Raleigh Creek-Other (**Figure 5**). No porewater samples were collected from Lake Elmo.

Downstream of Lake Elmo, the discharge from Lake Elmo and the pipe from Eagle Point Dam mix, resulting in higher PFBA concentrations than that observed in Eagle Point Lake but lower PFOS concentrations. In sediment, PFOS and PFOA were the only compounds consistently detected and concentrations were similar to those measured in Lake Elmo. Porewater concentrations of PFOS and PFOA downstream from Lake Elmo within the West Lakeland Area were less than those measured in Eagle Point Lake. PFOS concentrations in surface water and sediment in the West Lakeland Area showed a slightly wider range of concentrations than in Lake Elmo, but on average PFOS concentrations in both areas were similar (**Figure 5**).

4.2 Foam

Foam forms as a result of the surfactant nature of PFAS and other organic compounds found naturally in surface water. The fluorine-carbon tail is hydrophobic or prefers to not be in water while the attached functional group (often referred to as the head) is often hydrophilic or prefers to be in water. These competing chemical properties cause PFAS to form a stable foam as the hydrophobic tails orient themselves together or with other hydrophobic organic matter in the water while the hydrophilic functional groups orient themselves with each other, water trapped within the foam, and other hydrophilic organic chemicals in the water. In surface water impacted with PFAS, foam formation requires turbulence to introduce air bubbles. This turbulence can be a result of water flow around rocks or other debris in the stream, flow through a culvert, or wind action. For larger piles of foam to accumulate, a calm area downstream of the turbulence with a solid substrate for the foam to accumulate against is required.

While the location and physical appearance of foam is variable, foam is consistently observed along both sections of Raleigh Creek, including when Raleigh Creek-Upper was not flowing into the confluence. The size of the accumulated foam piles ranged from the more frequently observed small accumulations along the stream banks to the less frequently observed accumulations of larger piles of 6 inches in height or more than a foot in length. Foam concentration data are presented in **Appendix A**. PFOS concentrations ranged from 30.7 to 13,800 µg/L in Raleigh Creek-Upper and 1.57 to 2,750 µg/L in Raleigh Creek-Other, which is up to 26,000 times higher than PFOS concentrations detected in surface water of these areas. The foam has been observed year round in various locations within Raleigh Creek (although not consistently in the same location) and ranged from larger fluffy piles to thinner piles along the stream banks. Changes in the water level of the stream changes the location of the turbulence and, therefore, the location of the foam. The length of time foam is present at a single location has been found to be variable from limited observations and is not well understood.

Foam was only observed in Eagle Point Lake as a result of turbulence from pumping of Goose Lake. In Lake Elmo, foam was often observed to accumulate along the lake shore in the downwind direction on windy days. PFOS concentrations in foam collected at different times from Lake Elmo ranged from 216 to 904 µg/L. A duplicate foam sample was collected from Lake Elmo (location EP21) and all detected compounds generally had a relative percent difference of less than 10% within that sample.

In the West Lakeland Area, foam was only observed at two locations in stream channels (WL6 and WL11) between larger waterbodies as there is much less stream turbulence to generate the foam in these channels compared to Raleigh Creek. Both of the locations with foam observations in West Lakeland have high turbulence because of culverts which promotes the introduction of air into the surface water and formation of foam. The foam collected from WL6 during the BERA sampling event had the highest PFOS concentration at 20,700 µg/L. Foam collected at this same location in February 2020 had a PFOS concentration of 1,630 µg/L, showing the temporal variability in PFOS concentrations in the foam at a single location. This temporal variability in foam PFOS concentrations has been observed at other locations as well and it is not understood what environmental factors influence the variability.

The range in PFOS concentrations within the foam could be a result of variable PFAS concentrations in the surface water where the foam forms, age of the foam, water body type, and the amount of other organic matter contributing to foam formation. PFOS was the dominant PFAS detected in foam samples, but PFOSA and N-EtFOSAA were also detected at elevated concentrations relative to the surface water concentrations.

4.3 Biological Tissue

Biological tissue samples were collected in September 2020 to support the BERA food chain model including the primary prey items such as benthic invertebrates (crayfish), amphibians, forage fish, and predatory fish that could be consumed by birds and mammals. Other tissue samples collected included snails and bottom-feeding fish (bullhead). These tissue types were not included in the food web model but are discussed below relative to the observed PFAS trends in these species.

Details regarding the composition of tissue samples including the type of sample (individual or composite), type of tissue (e.g., whole body, fillet), species identification, and specimen measurements are provided in Tables 1 through 6 in **Appendix B**. Summary statistics for each tissue type are included in in **Appendix D**. The biological tissue data are discussed in the sections below. **Figure 6** present boxplots of the tissue data for PFOS across tissue types and sampling areas. This figure is useful for looking at trends related to waterbodies and to the trophic levels of the organisms collected. **Figures 7a through 7f** identify the distribution of individual detected PFAS in each tissue sample.

4.3.1 Amphibians

Amphibian tissue samples were collected in Raleigh Creek-Upper, Raleigh Creek-Other, Eagle Point Lake, and the West Lakeland Area and consisted of tadpole composite samples and adult frog whole-body samples (see **Appendix B Table 1** for species and size information). No amphibian tissue samples were collected in Lake Elmo. The tadpoles and adult frogs were identified as green frogs. In Raleigh Creek-Upper, eight samples were collected consisting of three tadpole composite samples (ranging from 4 to 7 individuals per composite) and five individual adult samples. Six samples were collected in the West Lakeland Area including three tadpole and three adult samples. One adult sample was collected in Eagle Point Lake, and one tadpole and two adult samples were collected in Raleigh Creek-Other.

PFOS measured in the amphibian samples are presented for each area in boxplots in **Figure 6.** Highest concentrations of PFOS were detected in amphibian tissue samples collected in Raleigh Creek-Upper whereas the concentrations detected in Raleigh Creek-Other, Eagle Point Lake, and West Lakeland were comparable in range. The range of concentrations detected in amphibians is greater than the ranges detected in snail and crayfish tissue samples but less than forage and predatory fish tissue samples collected in the same areas. This is not unexpected as amphibians, particularly adult frogs consuming insects, worms, small frogs and fish, are at a higher trophic level in the food chain than snails (consuming algae) and similar to or above crayfish (consuming plants, benthic worms, small fish, and detritus).

As indicated in **Figure 7a**, PFOS was generally the dominant PFAS detected in amphibian tissues. Samples collected from locations closer to the ODS in Raleigh Creek-Upper (i.e., RC3A, RC4A) contained higher fractions of PFOSA than downstream samples. The amphibian sample collected from location RC16A in the Project 1007 stream prior to the confluence with Raleigh Creek contains the smallest fraction of PFOS and greater fractions of other PFAS.

PFOS concentrations detected in adult samples ranged higher than in tadpole samples. In adult samples, PFOS ranged from 31 to 737 µg/kg with an average of 217 µg/kg. In tadpoles, PFOS ranged from 3 to 137 µg/kg with an average of 80 µg/kg. The weights of the adult samples ranged from 11.5 to 35 grams (g) and tadpole samples ranged from 2 to 6 g.

4.3.2 Crayfish

Crayfish samples were collected in Raleigh Creek-Upper, Raleigh Creek-Other, Eagle Point Lake, and the West Lakeland Area. No crayfish tissue samples were collected in Lake Elmo. A total of seven samples were collected in Raleigh Creek-Upper, 11 samples in Raleigh Creek-Other, nine samples in Eagle Point Lake, and 12 samples in the West Lakeland Area (see **Appendix B Table 2** for size information). Most samples are individual whole-body samples (25 male and 12 female specimens) ranging in size from 4.1 to 103 millimeters (mm) in length and 2 to 28.4 g in weight. One composite sample consisting of two small specimens (49 to 53 mm and 2.5 to 3 g) was collected in Raleigh Creek-Upper.

One whole crayfish (WL15A) was removed in the tissue processing lab from the gut of a large largemouth bass collected from the West Lakeland Area. This crayfish specimen was analyzed as an individual whole-body tissue sample.

PFOS concentrations detected in crayfish tissue samples ranged from 2.3 to 153 µg/kg with an average of 35 µg/kg. PFOS measured in the crayfish samples are presented for each area in **Figure 6**. Similar to amphibians, the highest concentrations were detected in crayfish collected in Raleigh Creek-Upper followed by the West Lakeland Area. PFOS in tissue measured in Raleigh Creek-Other, Eagle Point Lake, and the West Lakeland Area showed overlapping ranges. The range of concentrations detected in crayfish is comparable to ranges detected in snail tissue and less than amphibian, forage fish, and predatory fish tissue samples collected in the same areas.

Figure 7b shows that PFOS and PFOSA were generally the dominant PFAS detected in crayfish tissues. In several samples collected from locations within Raleigh Creek-Upper (i.e., RC3A, RC23), higher fractions of PFOSA than PFOS were detected and PFOSA accounted for approximately 20% of the total detected PFAS in Eagle Point Lake. In the West Lakeland Area, very little PFOSA was detected and PFOS was the dominant PFAS in crayfish tissues.

4.3.3 Snails

Snail tissue samples were collected opportunistically when available and they are expected to represent a potential prey item for receptors like herons and raccoons. Two composite snail tissue samples were collected in Raleigh Creek-Upper, and four individual and two composite snail tissue samples were collected in Eagle Point Lake. Composite samples consisted of two to four individual specimens. Snails ranged from 15 to 47 mm in length and 3 g to 25.5 g in weight (**Appendix B Table 3**).

PFOS concentrations detected in snail tissue samples from 10.7 to 98.1 µg/kg with an average of 53.1 µg/kg. PFOS measured in the snail samples are presented for each area in **Figure 6**. The range of concentrations measured in snail tissue samples collected in Raleigh Creek-Upper and Eagle Point Lake overlap with the highest concentrations measured in the latter area. Snail concentrations are comparable in range to crayfish and lower than amphibian, forage fish, and predator fish tissue samples collected in the same areas.

Similar to crayfish, snail tissue collected from locations within Raleigh Creek-Upper (i.e., RC3A, RC23) were dominated by PFOS and PFOSA (**Figure 7c**) and contained higher fractions of PFOSA than downstream samples collected from Eagle Point Lake. Samples collected from locations in Eagle Point Lake (i.e., EP17C, EP27B, EP4) were dominated by PFOS.

4.3.4 Bottom Fish

Bottom fish tissue samples were collected opportunistically when available in three areas: Raleigh Creek-Upper (two samples), Raleigh Creek-Other (one sample), and Eagle Point Lake (two samples). Each whole-body sample consisted of an individual specimen of bullhead, which are one of the dominant species in Eagle Point Lake (VBWD, 2015). The bottom fish specimens ranged in size from 12.7 to 225 mm in length and 23 to 192 g in weight (**Appendix B Table 4**).

PFOS concentrations detected in bottom fish samples ranged from 58.7 to 918 µg/kg. The upper end of the range is driven by the two specimens collected in Raleigh Creek-Upper (882 and 918 µg/kg) in contrast to the much lower concentrations detected in the three specimens from Raleigh Creek-Other (58.7 µg/kg) and Eagle Point Lake (112 to 212 µg/kg). This range of concentrations detected in bottom fish overlaps with ranges of forage fish tissue concentrations measured in samples collected in the same areas (**Figure 6**).

Figure 7d shows that the two bottom fish samples collected from Raleigh Creek-Upper were not dominated by PFOS. One sample was dominated by PFOSA (i.e., RC7) and the other by perfluorododecane sulfonic acid (PFDoS) (i.e., RC22). The three samples collected from locations in Raleigh Creek-Other (i.e., RC18) and Eagle Point Lake (i.e., EP1A and EP27C) were dominated by PFOS.

4.3.5 Forage Fish

Forage fish tissue samples were collected from Raleigh Creek-Upper, Raleigh Creek-Other, Eagle Point Lake, Lake Elmo, and the West Lakeland Area for use in the BERA (see **Appendix B, Table 5** for species and size information). The forage fish species collected within these exposure areas included black crappie, bluegill, cisco, golden shiner, fathead minnow, darter, stickleback, mudminnow, and sunfish (including green and red ear).

In Raleigh Creek-Upper, six whole-body samples were collected, four of which are composite samples consisting of two to six individuals which included multiple species and two represent individual specimens (golden shiner and mudminnow). Seven samples were collected in Raleigh Creek-Other including five composite samples which included multiple species and two individual samples (green sunfish). Eight samples were collected in Eagle Point Lake including one whole-body composite of mudminnows and seven individual samples of crappie, green sunfish, and bluegill. Nine samples were collected in Lake Elmo including one whole-body composite of bluegills and eight individual samples of crappie, cisco, and bluegill. In the West Lakeland Area, a total of 26 whole-body individual samples were collected and all were bluegill except one green sunfish.

The smallest forage fish specimens were collected in Raleigh Creek-Upper where the average weight was 14.5 g per sample. Larger individual specimens were collected downstream and as such, the average weight per sample increased from 28.5 g in Raleigh Creek-Other to 139 g in Eagle Point Lake, 85 g in Lake Elmo, and 57 g in the West Lakeland Area. Most specimens were between 1 to 2 years old (if age was recorded).

PFOS concentrations detected in forage fish tissue samples ranged from 6.15 to 6,350 µg/kg, which is higher than the maximum for all other tissue type samples as indicated in the boxplots in **Figure 6**. Highest PFOS concentrations were detected in Raleigh Creek-Upper forage fish (average concentration of 4,950 µg/kg). The widest range of concentrations was measured in Raleigh Creek-Other (average of 215 µg/kg). The range of concentrations measured in Eagle Point Lake, Lake

Elmo, and West Lakeland Area overlapped with slightly higher levels in Eagle Point Lake (averages of 1,630 µg/kg, 803 µg/kg, and 894 µg/kg, respectively).

Figure 7e shows that PFOS was the dominant PFAS detected in forage fish tissues. PFOSA was detected at low levels in samples collected within Raleigh Creek-Upper (i.e., RC3A, RC4A, RC5, RC7, RC22) and was rarely or never detected further downstream. Samples collected from locations in Raleigh Creek-Other (i.e., RC16A, RC21A, RC17) contained a more variable mix of PFAS than samples collected in Raleigh Creek-Upper, Eagle Point Lake, Lake Elmo, or the West Lakeland Area. These differences in PFAS distribution are likely associated with proximity to different sources with PFOSA detected in samples closest to the ODS and the more variable mix of PFAS detected in fish more likely to be exposed to discharge associated with groundwater and/or the WCL (**Figure 1).**

4.3.6 Predator Fish

Specimens of predator fish, including largemouth bass and northern pike, were collected in Eagle Point Lake, Lake Elmo, and the West Lakeland Area for use in the BERA (see **Appendix B, Table 6** for species and size information). In Eagle Point Lake, five individual largemouth bass samples were collected with an average total sample weight of 478 g. In Lake Elmo, eight samples were collected (three northern pike and five largemouth bass) with an average weight of 508 g. In the West Lakeland Area, 12 largemouth bass samples were collected with an average weight of 360 g.

PFOS concentrations detected in predator fish tissue samples are comparable but slightly higher than the ranges detected in forage fish tissue samples and higher than other tissue sample types collected in the same areas, as indicated in boxplots in **Figure 6**. The highest PFOS concentrations were detected in Eagle Point Lake (average of 2,242 µg/kg), with Lake Elmo and West Lakeland having nearly equivalent average concentrations (1,198 and 1,196 µg/kg, respectively).

The distribution of PFAS in predator fish tissues collected from Eagle Point Lake, Lake Elmo, and the West Lakeland Area (**Figure 7f**) was similar to forage fish collected from the same waterbodies with PFOS accounting for nearly all of the detected PFAS.

5.0 Problem Formulation

The BERA Problem Formulation provides the framework for the BERA and serves to define the risk assessment objectives and the geographic area to be considered. It also identifies the ecological receptors, exposure pathways, and endpoints to be evaluated. This information was previously included in the BERA Work Plan (AECOM, 2020a) and is reiterated and updated to reflect current information, as needed, below to ease review of the BERA.

As stated previously, the primary objective of the BERA is to evaluate whether or not populations of ecological receptors are potentially at risk due to exposure to PFAS present in environmental media within the Project 1007 waterways. Protection at the individual-level is appropriate if listed species are present. As indicated in **Table 1**, several listed species may occur in the vicinity of the Project 1007 waterways. The potential risk implications for listed species that may occur in the waterways are considered in Risk Characterization provided in Section 7. In particular, this includes two fish species (least darter and pugnose shiner), the Forster's tern, and the Blanding's turtle documented by the NHIS (MNDNR, 2021c). Although not identified by the NHIS, the federally-listed long-eared bat is also discussed.

The geographic extent of the study area, ecological receptors, the exposure pathways, and the biological endpoints to be considered in the BERA are summarized in the following sections and the ecological CSM is presented in Section 5.4. The CSM describes potential sources, migration routes, routes of exposure, and potential receptors based on available information.

5.1 Geographic Extent of the Study Area

The SLERA (AECOM, 2020a) evaluated surface water, sediment, and foam data collected from the connected waterways within the Project 1007 area from the Tri-Lakes Area and the ODS, downstream to the discharge point in the St. Croix River. The primary finding of the SLERA was that concentrations of PFOS in surface water and sediment collected from Raleigh Creek, Eagle Point Lake, Lake Elmo, and the West Lakeland Area exceeded wildlife ESVs. One sediment sample collected in Eagle Point Lake also exceeded the wildlife ESV for PFOA. PFAS concentrations outside of these areas (e.g., downstream from the West Lakeland Area) were lower than the concentrations in these areas.

Therefore, the focus of the BERA sampling event was to characterize tissue concentrations within Raleigh Creek, Eagle Point Lake, Lake Elmo, and the West Lakeland Area and these areas are the focus of the quantitative BERA evaluations.

5.2 Identification of Ecological Receptors and Potentially Complete Exposure Pathways

As described in Section 2.2, ecological receptors potentially exposed to PFAS associated with the aquatic habitats of Project 1007 include aquatic plants, water column invertebrates, benthic invertebrates, fish, amphibians and reptiles, birds, and mammals. These receptors may be exposed to PFAS either through direct contact with abiotic media (e.g., sediment, surface water, foam) or through consumption of aquatic plants, invertebrates, or other dietary items (e.g., amphibians, fish).

Based on the fate and transport characteristics of PFAS and the findings of the SLERA, wildlife ingestion exposure pathways represent the highest potential for ecological risk within the Project 1007

aquatic habitats. Birds and mammals may consume lower trophic level organisms (aquatic plants, invertebrates, fish) that have bioaccumulated PFAS from environmental media. Based on the comparison of PFAS concentrations to wildlife-based ESVs in the SLERA, PFOS is the primary risk driver with benchmark exceedances for surface water and sediment throughout the waterways.

Direct contact exposures to PFAS in sediment and surface water by aquatic receptors such as invertebrates and fish showed far fewer potential risks in the SLERA than those identified for wildlife. However, additional evaluation was recommended at the conclusion of the SLERA to confirm that direct exposures to PFAS in surface water, sediment, and porewater pose minimal risks.

Additionally, PFAS-containing foam may also be a relevant exposure medium for fish, amphibians and aquatic invertebrates directly exposed to the material. Given that the foam is generally only present intermittently at different locations throughout the Project 1007 waterway and is not an aqueous medium, it is expected that most foam exposures are relatively short in duration and are not expected to result in long-term bioaccumulation into prey items. Therefore, only direct contact exposures for water column receptors were quantitatively evaluated in the BERA, with recognition of the uncertainty in assuming aquatic organisms would reside in the foam.

5.3 Selection of Assessment Endpoints and Measures of Effect

Ecologically-based assessment endpoints and measures of effect were designed to evaluate potential ecotoxicological effects associated with exposure to PFAS within the Project 1007 waterways. According to USEPA (1998), assessment endpoints are formal expressions of the actual environmental value to be protected. They usually describe potential adverse effects to long-term persistence, abundance, or production of populations of key species or key habitats. Typically, assessment endpoints and receptors are selected for their potential exposure, ecological significance, economic importance, and/or societal relevance.

Because assessment endpoints often cannot be measured directly, a set of surrogate endpoints (measures of effect) are generally selected that relate to the assessment endpoints and have measurable attributes (e.g., comparison of media concentrations to screening levels, results of food web models) (USEPA 1997, 1998). These measures of effect provide a quantitative metric for evaluating potential effects of constituents on the ecosystem components potentially at risk. Since each measure of effect has intrinsic and extrinsic strengths and limitations, several measures of effect may be used to evaluate each assessment endpoint.

Ecological receptors are defined as plant and animal populations, communities, habitats, or sensitive environments. If listed species are potentially present for a receptor group, protection at the individual level, rather than the community level is appropriate and is discussed in risk characterization (Section 7). The assessment endpoints and measures of effect selected for the BERA are:

Assessment Endpoint	Measure of Effect
Protection and maintenance of aquatic plant, fish, and water column invertebrate communities within aquatic habitats associated with Project 1007 at levels similar to those of nearby populations not exposed to Project 1007 PFAS.	Comparison of surface water and foam PFAS concentrations to screening levels protective of direct toxicity to aquatic life.
Protection and maintenance of benthic invertebrate communities within aquatic habitats associated with Project 1007 at levels similar to those of nearby populations not exposed to Project 1007 PFAS.	Comparison of sediment PFAS concentrations to direct toxicity freshwater sediment screening levels. Comparison of porewater PFAS concentrations to direct toxicity freshwater surface water screening levels for aquatic life.
Protection and maintenance of semi-aquatic and aquatic wildlife receptors (i.e., birds and mammals expected to forage within the aquatic habitats associated with Project 1007) at levels similar to those of nearby populations not exposed to Project 1007 PFAS.	Comparison of calculated total daily dose (TDD) from exposure to PFAS in surface water, sediment, and ingestion of contaminated prey items to chemical-specific toxicity reference values (TRVs).

Although reptiles may be exposed to PFAS in surface water and sediment, receptor-specific screening values are not available. Therefore, the potential for impacts to reptiles are assessed qualitatively. The available surface water screening levels were designed to be protective of aquatic plants and amphibians, in addition to water column invertebrates and fish.

5.4 Ecological Conceptual Site Model

The ecological CSM for aquatic habitats within the Project 1007 waterways helps to characterize the extent of PFAS contamination and identify mechanisms of fate and transport within the area. The presence of PFAS in surface water, sediment, or porewater may directly impact aquatic and semi-aquatic receptors present in the water bodies (e.g., fish, amphibians, invertebrates) or may result in bioaccumulation of PFAS into fish and other aquatic and semi-aquatic species that serve as prey items for birds and mammals foraging in the aquatic habitats. PFAS-containing foam may also be a temporary exposure medium for some ecological receptors. These PFAS exposures may pose unacceptable potential risk to some ecological receptors.

The purpose of the ecological CSM provided in **Figure 8** is to provide a clear and concise description of how ecological receptors may encounter PFAS via release mechanisms resulting in exposure to media in the aquatic habitats of Project 1007 and in aquatic habitats of connecting and adjacent waterways. The ecological CSM has been developed based on a review of the existing information regarding the impacted media at the site, likely transport pathways, and biological characteristics of the area.

5.4.1 Source Areas

The Project 1007 stormwater conveyance system was constructed to mitigate flooding in landlocked areas of the sub-watershed. The conveyance system transports water approximately 14 miles from the Tri-Lakes Area to the St. Croix River. South of the Tri-Lakes Area is the WCL where PFAS-

impacted water was discharged to the Project 1007 waterways in the late 1980s to the early 1990s. Another prominent water body in the area is Raleigh Creek. Raleigh Creek is a natural stream with headwaters west of Interstate 694 (I-694) that connects with the Project 1007 waterways south of the Tri-Lakes Area near Tablyn Park. Raleigh Creek drains the wetlands immediately around the former ODS where 3M historically disposed of wastes containing PFAS. Runoff from the ODS drains into Raleigh Creek and contributes to the eastward transport of PFAS-impacted surface water within the Project 1007 waterways.

As described in Section 2, the VBWD constructed the Project 1007 stormwater conveyance system in the late 1980s to prevent flooding in the Tri-Lakes area (DeMontreville, Olson, and Jane). This large flood control project directed the flow of water from the Tri-Lakes area through storm sewer pipes, open ditches and existing surface water bodies to the St. Croix River. The primary sources of PFAS contamination contributing to impacts within the Project 1007 waterways are surface water flow exiting the ODS via Raleigh Creek and historic discharges of groundwater from the WCL. Both sites are locations where PFAS manufacturing wastes were disposed of from the 1950s through the early 1970s.

As indicated in **Figure 1**, the ODS is located upstream of the Project 1007 stormwater conveyance route and connects to Project 1007 via Raleigh Creek at Tablyn Park (confluence). The WCL is located approximately 0.3 miles east of the upper reaches of Project 1007 and upstream of the confluence. The WCL was hydraulically connected to Project 1007 via a storm sewer pipe that was installed to divert water from the landfill groundwater gradient control system to the Project 1007 waterways. The connection between the landfill and Project 1007 discharged untreated water from the gradient control system between the late 1980s and the early 1990s. There may also be PFAS impacted groundwater that discharges into Project 1007 from the WCL.

5.4.2 Release Mechanisms and Exposure Media

PFAS wastes within the ODS and WCL were directly discharged into the surface water of the Project 1007 stormwater conveyance route or tributaries to the Project 1007 waterways. Migration of PFAS is expected to occur from these source areas through surface water and groundwater since PFAS are highly soluble in water such that releases at the surface typically result in vertical migration to groundwater. Surface water runoff can also provide a pathway for PFAS to migrate from the disposal sites via channelized or sheet flow leading to downgradient waterbodies.

PFAS leached from the disposal sites into the groundwater and were then transported both vertically and laterally from these primary sources. PFAS in groundwater may discharge into downgradient waterbodies (referred to as gaining stream conditions) and, in some cases, constituents in surface water may discharge into the groundwater (referred to as losing stream conditions). An on-going source assessment is investigating the connections between surface water and groundwater from Project 1007.

Although PFAS are highly water soluble, some may have been adsorbed onto sediment particles within the waterbodies. It is likely that sediment particles containing PFAS are mobilized during storm

events and settle out in downstream depositional areas. PFAS may also be desorbed from sediment particles into the water column at locations downstream or downgradient of the original source areas.

PFAS-containing foam has also been observed within some Project 1007 waterbodies and tributaries (e.g., Project 1007 upstream of the confluence, Raleigh Creek both upstream and downstream of the confluence, Eagle Point Lake, and the stream channel within the West Lakeland Area) and within adjacent waterbodies (Sunfish Lake and Valley Branch Creek). The Michigan Department of Health and Human Services (MDHHS) published a factsheet regarding foam on surface water bodies describing this occurrence (MDHHS, 2019): "Foam can occur naturally or because of pollution in the water. Natural foam can form from decomposing plants and algae and could contain bacteria. Chemicals, like surfactants or detergents, in the water also cause foam on lakes and rivers." Foam generation within Project 1007 is likely caused by agitation in streams due to rapid water flows or in lakes due to wind and wave action. The concentrations of PFAS in foam is related, in part, to the concentration of PFAS in the underlying surface water and the degree to which PFAS concentrates in the foam during the fractionation process. The extent to which natural organic matter contributes to foam formation in the different areas of Project 1007 is unknown.

5.4.3 Ecological Exposure Pathways

A complete ecological exposure pathway is defined in USEPA guidance (1997, 1998) as "one in which the chemical can be traced or expected to travel from the source to a receptor that can be affected by the chemicals." Each exposure pathway includes a potential source of a contaminant, an environmental medium, and a potential exposure route. An exposure pathway must be complete before exposure of receptors to chemicals can occur. A complete exposure pathway must have the following five elements:

1. A source (e.g., PFAS waste);

2. A mechanism for release and migration of chemical (e.g., discharge to surface water);

3. An environmental/physical transport and exposure medium (e.g., surface water, sediment);

4. An exposure point or site of potential contact (e.g., impacted surface water body); and

5. A receptor and route of intake (e.g., dietary ingestion of prey that have taken up PFAS).

If one or more elements are not present, the pathway is incomplete. In accordance with agency guidance, incomplete routes of exposure are not evaluated in the ERA.

PFAS in surface water and sediment may be contacted directly by aquatic plants, fish, reptiles, amphibians, and aquatic and benthic invertebrates living in the water column or sediment. Sediment porewater represents a potential exposure medium for aquatic plants and benthic invertebrates at the groundwater-surface water interface. Wildlife foraging within the Project 1007 waterways could also be exposed directly to PFAS through ingestion of drinking water, incidental ingestion (e.g., ingestion during preening or during foraging activities), and indirectly by ingestion of contaminated prey items. Uptake of PFAS through the different levels of the wildlife food web (trophic levels) can occur through the process of bioaccumulation, and some PFAS may biomagnify.

Chemicals that biomagnify can significantly increase in concentration up the food web, typically having greatest concentrations in the tissue of tertiary level carnivorous or piscivorous (fish-eating) birds and mammals. Conder et al. (2008) noted that the biomagnification of PFAS in aquatic food webs is

lower than that of most persistent lipophilic compounds, with PFOS being the only perfluorinated acid consistently exhibiting the potential for biomagnification. Penland, et al. (2020) found evidence of PFOS biomagnification for several fish species (e.g., bluegill, channel catfish, whitefin shiner), in a freshwater stream system in North Carolina with low levels of PFOS in the water and sediment (0.0043 µg/L in surface water and 0.56 µg/kg in sediment).

Aquatic plants, fish, reptiles, amphibians, aquatic invertebrates, and wildlife may also be exposed to foam on the water surface, when present. Due to the intermittent and typically localized presence of the foam, it is expected that most foam exposures are relatively short in duration and are generally limited to certain locations where the foam has been observed to accumulate. The intermittent and typically localized presence of foam would preclude the potential for bioaccumulation along most of the Project 1007 waterways, with the possible exception of the localized areas where foam has been observed to accumulate more frequently (e.g., sections of Raleigh Creek) and where PFAS may be present in higher concentrations in nearby sediment, plants, and aquatic invertebrates. Direct acute exposure by aquatic plants, fish, reptiles, amphibians, invertebrates, birds, and mammals to foam represents a potentially complete pathway that is challenging to quantify, as foam is not a solid or aqueous medium with readily applicable ESVs and may contain approximately 90% air (Schilling and Zessner, 2011).

6.0 Risk Analysis

The risk analysis phase of the BERA is based on the CSM developed in the problem formulation. Risk analysis includes both the characterization of potential ecological exposure and effects. The ecological exposure assessment involves the identification of potential exposure pathways and an evaluation of the magnitude of exposure for the identified ecological receptors. The ecological effects assessment describes the potential adverse effects associated with the identified COPECs to ecological receptors and reflects the type of assessment endpoints selected. The data and methods that were used to identify and characterize ecological exposure and effects are described in the following sub-sections.

6.1 Risk Analysis for Lower Trophic Level Receptors

The evaluation of risks to aquatic plants, fish, aquatic and benthic invertebrates, and amphibians focused on the comparison of PFAS concentrations in surface water, sediment, or porewater against appropriate risk-based sediment and surface water ESVs provided in **Table 3**. The ESVs are consistent with those used in the SLERA (AECOM, 2020a) and include the following:

- Surface water and porewater
    - o Freshwater aquatic life protection values from Conder, et al (2020) referred to as the hazardous concentration 1% (HC1). These values are protective of 99% of aquatic species. Given the conservative nature of the HC1, data were also considered relative to the hazardous concentration 5% (HC5) which is protective of 95% of aquatic species. This level of protection is similar to the level of protection afforded by EPA's National Recommended Water Quality Criteria for Aquatic Organisms (USEPA, 2018). The HC1 and HC5 ESVs are only available for PFOS and PFOA and were derived using data for freshwater fish, amphibians, plants, and invertebrates (including water fleas, insect larvae, and shellfish).
    - o Chronic recommended water quality risk-based screening levels (RBSLs) for aquatic life (Divine et al., 2020). Acute water quality RBSLs for aquatic life from Divine et al. (2020) were also used to evaluate foam data. Chronic RBSLs represent a 4-day average exposure and sublethal endpoints, while acute RBSLs represent a 1-hour average exposure and lethality as the endpoint.
- Sediment
    - o No effect value protective of benthic invertebrates directly exposed to PFOS in sediment (NPCA 2008). Recent literature from Conder et al. (2020) and Divine, et al. (2020) were reviewed, but lacked available sediment toxicity data for benthic invertebrates.

Surface water direct contact ESVs are available for 11 PFAS and only a single sediment direct contact ESV is available. For the remaining PFAS, appropriate ESVs from reasonable surrogates were identified. In general, surrogate ESVs were selected based on similar carbon chain lengths and functional groups (e.g., perfluoroalkyl sulfonic acids [PFSA], perfluoroalkyl carboxylic acids [PFCA]) (Divine et al., 2020, Zodrow et al., 2020).

Many of the selected surface water ESVs were developed in accordance with the USEPA's Great Lakes Initiative (GLI) methodology (USEPA, 2012; Divine et al., 2020; Zodrow et al., 2020). The GLI methodology provides a scientific approach for the derivation of two tiers of benchmarks (Tier I and Tier II) for the Great Lakes watershed, using robust datasets that are not yet sufficient for the formal

derivation of USEPA's ambient water quality criteria (AWQC). The methodologies allow for using different assessment factors to account for uncertainties associated with less than optimal datasets. Zodrow et al. (2020) and Divine et al. (2020) represent the most recent and comprehensive evaluation of PFAS aquatic toxicology to date and the authors used the GLI approach to develop PFAS benchmarks for use in ERAs.

Uncertainties in the selected benchmarks are expected to be low for data-rich PFAS for which GLI Tier I benchmarks are available (i.e., PFOS and PFOA). Higher uncertainties are expected for GLI Tier II benchmarks. Calculated benchmarks based on limited datasets and use of surrogates are expected to have the most uncertainty. Divine et al. (2020) assigned a moderate to high confidence in PFOS and PFOA Tier I values because they are based on a reasonably robust data set and multiple test species. Lower confidence was indicated for the rest because fewer than five acute toxicity values were available and four or fewer GLI species groups were tested.

Although only minimal exceedances of these ESVs were noted in the SLERA, the BERA re-evaluated the direct contact pathways using the updated dataset (i.e., data collected from the August 2019, Spring 2020, and September 2020 sampling events) and the expanded set of ESVs using surrogate values, as needed.

The direct contact pathways were evaluated for the following five exposure areas: Raleigh Creek-Upper, Raleigh Creek-Other, Eagle Point Lake, Lake Elmo, and the West Lakeland Area. Maximum detected concentrations in surface water, sediment and porewater from each area were screened initially to identify PFAS which warranted further evaluation using the media and area-specific UCL as the EPC for the direct contact evaluations. The evaluation of maximum detected concentrations is not typically included in a BERA, but was included here to confirm the findings of the SLERA using an expanded dataset and media not previously evaluated (i.e., sediment porewater, dissolved phase surface water). **Appendix F** provides the area- and media- specific screening tables.

The UCL was used to represent overall PFAS exposure for benthic invertebrates and aquatic organisms within a particular area. To estimate risks based on direct exposures to surface water, sediment, and porewater, hazard quotients (HQs) were calculated by comparing the EPC for each PFAS (i.e., an estimate of exposure) to the appropriate media-specific ESV (i.e., an estimate of effects) using the following formula:

$$HQ = EPC / ESV$$

PFAS with HQs greater than 1 based on the UCLs were subjected to a more intensive investigation of the data (e.g., detection frequency, magnitude of screening level exceedances, locations with exceedances, confidence in the screening levels, etc.) to build a weight of evidence upon which to base conclusions regarding the potential for ecological risk.

While ecological receptors may be exposed to PFAS in foam, there are uncertainties associated with the mechanism of exposures and the availability of relevant toxicity data and screening levels for foam. Since foam is a more transient and stationary exposure medium than surface water and occurs in individual locations, the foam data were evaluated on a sample-by-sample basis, rather than with UCLs which are more appropriate for exposures averaged over an area. PFAS concentrations were identified if they exceeded either the acute or chronic surface water ESVs. The sample-by-sample foam screening table is provided in **Appendix F**.

6.2 Vertebrate Wildlife Community Risk Analysis

Potential exposure routes for wildlife receptors include potential intentional or incidental ingestion of surface water and sediment, and ingestion of PFAS-contaminated food items (e.g., prey items that have ingested PFAS or plants contaminated via root uptake). The actual amount of exposure to contaminants in the environment by wildlife species as the result of surface water, sediment, or food ingestion depends on several factors.

As an initial assessment of potential wildlife risks, surface water, sediment, and porewater data were compared against wildlife-based surface water and sediment ESVs based on no observed adverse effects level (NOAEL) RBSLs derived by Divine, et al. (2020). These ESVs were derived using food web models based on consumption of plant and prey items impacted by PFAS in water or sediment. The selected wildlife ESVs, shown in **Table 3**, for this initial screen were the lowest of the values derived for the muskrat, little brown bat, river otter, mink, red-winged blackbird (*Agelaius phoeniceus*), tree swallow (*Tachycineta bicolor*), and brown pelican (*Pelecanus occidentalis*). Although not present in the Project 1007 waterways, brown pelican values were utilized based on the need for a piscivorous bird receptor in the evaluation.

In addition to the initial wildlife ESV screen, food web evaluations were completed for the same five exposure areas evaluated for lower trophic level receptors: Raleigh Creek-Upper, Raleigh Creek-Other, Eagle Point Lake, Lake Elmo, and the West Lakeland Area. As shown in **Figures 9 through 11**, the areas under evaluation include a variety of aquatic and wetland habitats. These habitat types include creek and wetland habitats within Raleigh Creek, large open water lake habitat (e.g., Eagle Point Lake and Lake Elmo), and creeks and ponds in the West Lakeland Area. These figures diagram the targeted indicator receptors that were considered in the BERA, including the fish, avian and mammalian indicator species and the feeding guilds they represent.

Some receptor diets (e.g., raccoon, and mink) were slightly modified from those presented in the Work Plan (AECOM, 2020b) to account for potential ingestion of amphibian tissue collected during the BERA field effort.

In addition, due to the availability of fish species at the sampling locations during the September 2020 sampling event, additional forage and predatory fish species were collected. Predatory fish were not anticipated to be present in the West Lakeland Area; therefore, mink and river otter diets in the Work Plan (AECOM, 2020b) did not include predatory fish. Due to the presence of and collection of ample fish samples (see **Appendix B**) within the West Lakeland Area (including predatory fish), the mink and river otter diets were modified to include a higher proportion of fish, including predatory fish, and are now consistent with the dietary assumptions applied to Eagle Point Lake and Lake Elmo.

Wildlife exposure parameters and concentrations of PFAS in sediment, surface water, and food items were used to estimate the potential ingested doses to which wildlife receptors might be exposed within the Project 1007 waterways. Calculation of these ingested doses is discussed below. The models used in this BERA are deterministic models, meaning they represent the average, expected behavior within an exposure area, but lack random variation. In the BERA, single values were selected to represent the exposure parameters such as ingestion rates, body weight, etc. The area-specific food web models are provided in **Appendices G through K**.

6.2.1 Representative Species

Because it is not practical to quantify risks for all species potentially present on a given site, representative wildlife species were selected as receptors for the BERA. The representative aquatic

and semi-aquatic mammalian receptors selected for the food web model included species used in derivation of wildlife RBSLs (Divine et al. 2020) and additional species more likely to forage in the project area. The representative species were selected to include a range of foraging habitats, protective of the guilds for special status and common species that potentially occur within the Project 1007 waterways. The selected species were presented in the Work Plan (AECOM, 2020b) and are discussed below.

Aquatic and Semi-Aquatic Birds. The creeks, streams, ponds, wetlands, and lakes of Project 1007 offer foraging opportunities for various types of waterfowl, wading birds, shorebirds, and top-level piscivores. Of the two state-listed special status bird species identified in **Table 1**, the red-shouldered hawk is expected to be found in upland areas more than within the Project 1007 waterways. However, the Forster's tern may forage within the Project 1007 waterways. Of the migratory birds that are known or suspected to breed in the area, the Henslow's sparrow is an upland ground-feeder that prefers terrestrial invertebrates and seeds rather than the benthic and aquatic insects and plants within the Project 1007 waterways; however, both the bald eagle and the osprey may forage on fish, particularly within Eagle Point Lake and Lake Elmo. Avian receptors were identified to represent the various feeding guilds present in the waterways and to provide surrogates receptors for special status birds potentially foraging in the waterways (i.e., Forster's tern, bald eagle, osprey).

The wood duck, tree swallow, spotted sandpiper, great blue heron, and bald eagle were selected as the representative avian species for evaluation in the food web model. The wood duck is representative of herbivorous birds consuming primarily aquatic plants and is assumed to be protective of the trumpeter swan given its similar diet but lower body weight. The tree swallow is representative of insectivorous birds consuming aquatic emergent flying insects. The spotted sandpiper, a common indicator species used in ERAs, is representative of invertivorous/omnivorous birds consuming primarily benthic invertebrates and a relatively high quantity of sediment. The heron is a piscivorous wading bird consuming primarily forage fish and is also a common indicator species used in ERAs. The bald eagle is a raptor likely to forage within the lake and river habitats; although they forage heavily on fish, other prey items include reptiles, amphibians, birds, and small mammals. However, for the purposes of the BERA, the eagle was assumed to have a diet comprised solely of fish in order to represent piscivorous birds that consume forage fish and predatory fish (e.g., those that may have bioaccumulated higher concentrations of PFAS). The heron and eagle are presumed to be protective of the Forster's tern, which has a diet of small fish, given that the heron has more direct contact with sediment and surface water (the tern dives rather than forages in shallow water) and both the eagle and heron ingest larger fish prey with potentially higher levels of PFAS. The eagle is also assumed to be protective of osprey protected under the MBTA.

Aquatic and Semi-Aquatic Mammals. No aquatic or semi-aquatic special status mammals were identified as potentially occurring at or near the Project 1007 waterways (see **Table 1**). The creeks, streams, ponds, wetlands, and lakes of Project 1007 offer a variety of foraging opportunities for mammals. The muskrat, little brown bat, mink, raccoon and river otter were selected as representative mammalian species. The muskrat is representative of herbivorous mammals consuming primarily rooted aquatic plants. The little brown bat is representative of insectivorous mammals consuming aquatic emergent flying insects. The mink is representative of omnivorous mammals consuming fish, benthic and aquatic invertebrates, and plants and may be present in the perennial waterbodies. The mink is often selected for evaluation in ERAs when bioaccumulative chemicals are of concern, as their potentially highly piscivorous diet and small body weight results in them being a sensitive receptor. The raccoon is a larger omnivorous mammal that is adaptive to both terrestrial and aquatic habitats; therefore, it was selected as the omnivorous mammal more likely to be

present in the creek habitats, which may be seasonally dry. The river otter is a piscivorous mammal consuming primarily fish and is likely to inhabit the larger, deeper waterbodies (ponds and lakes).

6.2.2 Estimation of Exposure

Exposure assumptions (e.g., body weights, food and water ingestion rates, relative consumption of food items, foraging range, seasonal use, etc.) for the selected target wildlife species are provided in **Table 4** with supporting documentation provided in **Appendices G through K**. As discussed in the SLERA and BERA Work Plan (AECOM, 2020a), the parameters presented by Divine et al. (2020) were reviewed and adjusted to reflect Minnesota receptors as needed. As noted above, subsequent dietary modifications were made for some target receptors to account for potential ingestion of amphibian tissue collected during the BERA field event, as well as potential ingestion of predatory fish tissue collected at the West Lakeland Area. These dietary modifications are captured in **Table 4**.

As discussed in Section 3.3, the UCL can be used as an EPC to represent overall PFAS exposure for a receptor community (i.e., benthic invertebrates, aquatic invertebrates, fish, wildlife) within a particular area if there are sufficient samples. If sufficient sample numbers were not available to calculate a UCL, the maximum detected concentration was used as the EPC. The sediment, surface water, and tissue EPCs used in the food web models are identified in the individual area-specific models presented in **Appendices G through K**.

6.2.2.1 Food Item Tissue Concentrations

Prey items for wildlife species evaluated in the food web exposure models include aquatic plants, benthic and aquatic invertebrates, amphibians, forage fish, and predatory fish. As described in Section 3.2, a BERA sampling event was conducted to target tissues for use in the food web model, and to provide a better understanding of PFAS concentrations in biological tissues in the Project 1007 waterway. When available, site-specific tissue data were preferentially used in the food web model. In the absence of site-specific tissue data, tissue concentrations were estimated using Project 1007-specific uptake factors (for amphibians and crayfish) or literature-derived uptake factors (for aquatic plants and aquatic invertebrates).

Snails and bottom fish were collected opportunistically in portions of Raleigh Creek and Eagle Point Lake and were not intended for inclusion in the food web models due to their smaller sample sizes. As shown in **Figure 6**, snail concentrations of PFOS were similar to the crayfish concentrations used to represent benthic invertebrates in the food web models, and bottom fish concentrations were lower than the forage fish and predator fish PFOS concentrations evaluated in the food web models. Therefore, excluding snails and bottom fish from the food web model is not expected to under-estimate wildlife risks.

Site-specific tissue data were used in the relevant exposure areas from which the data were collected. Based on biota availability and presence, not all tissue types were able to be collected from all exposure areas. In these limited instances (i.e., amphibians and crayfish in Lake Elmo [no samples were collected] and amphibians in Eagle Point Lake [only a single sample was collected]), site-specific bioaccumulation factors (BAFs) were developed based on the available tissue and surface water data from elsewhere in the Project 1007 waterway (**Appendix E**).

In general, BAFs were calculated by dividing an individual tissue sample concentration (e.g., PFOS in an amphibian sample from Raleigh Creek-Upper) by the geometric mean of the detected surface water concentrations for the area where the biological sample was collected (e.g., PFOS in surface water from Raleigh Creek-Upper). This process was repeated for each amphibian and crayfish

sample with detected concentrations of PFAS. Then the geometric mean of the individual BAFs was calculated over selected areas with surface water concentrations similar to the surface water in the areas where the BAFs were to be applied. This approach is similar to the approach used by MPCA to derive PFOS BAFs for fish (MPCA, 2020b).

Total surface water concentrations, rather than dissolved phase, were used to derive the BAFs because crayfish and amphibians may ingest particulate matter associated with the surface water and a larger total surface water data set was available in each area (dissolved phase data were only collected in the BERA sampling event). As discussed in Section 7.3.5, dissolved and total surface water concentrations were generally similar, and the differences did not necessarily follow any clear patterns. While sediment and porewater data were also available near the crayfish and amphibian sample locations, the sediment data were more spatially variable, PFAS were detected less frequently in sediment and porewater than in surface water, and crayfish and amphibians may not be significantly exposed to porewater compared to surface water or sediment. The surface water data are expected to be reasonable for estimating bioaccumulation into mobile crayfish and amphibians foraging within an exposure area. While only a sub-set of BAFs were calculated for use in the BERA, the available data provided in **Appendix A** can be used to derive BAFs for other media-tissue pairs that may be relevant to deriving cleanup goals.

Amphibian and crayfish tissue concentrations were calculated for use in the Lake Elmo and Eagle Point Lake food web models by selecting BAFs for areas that have comparable levels of PFAS detected in surface water, which in most cases are Eagle Point Lake and the West Lakeland Area. When individual BAFs were not available for these areas, BAFs calculated for other areas including Raleigh Creek-Upper and Raleigh Creek-Other were included in the calculation. The site-specific BAFs used in the food web models are presented in **Table 5** and the BAF calculations are provided in **Appendix E**.

Since aquatic plants and aquatic (water column) invertebrates were not collected within the Project 1007 waterways, these tissue concentrations were estimated using literature-derived uptake factors.

The available surface water-to-aquatic plant BAFs from Conder et al. (2020), Divine et al. (2020), and Zodrow et al. (2020) and the aquatic plant biota sediment accumulation factors (BSAF) from Divine et al. (2020) and Zodrow et al. (2020) were reviewed for potential use in the BERA. Conder et al. (2020) and Divine et al. (2020) were funded by the Department of Defense (DoD) under the Environmental Security Technology Certification Program (ESTCP) and Strategic Environmental Research and Development Program (SERDP). Zodrow et al. (2020) is a peer-reviewed journal article that builds on the findings in Divine et al. (2020).

Ultimately, the surface water-to-aquatic plant BAFs from Divine et al. (2020) and Zodrow et al. (2020) were selected for use in this BERA based on the plant species most likely ingested by wildlife and the higher frequency of detection of PFAS in surface water relative to sediment. However, the potential for adverse effects to herbivorous receptors was further explored in the risk characterization phase for risk driving PFAS through an evaluation of plant tissue concentrations derived via sediment-plant BSAFs. Surrogate BAFs were used, as needed, and were selected based upon similarity of the functional groups and/or number of perfluorinated carbons (Divine et al. 2020, Zodrow et al. 2020).

Similarly, for aquatic invertebrates the available surface water-to-aquatic invertebrate BAFs from Conder et al. (2020), Divine et al. (2020), and Zodrow et al. (2020) were reviewed for potential use in the BERA. Ultimately, the surface water-to-aquatic invertebrate BAFs from Divine et al. (2020) and Zodrow et al. (2020) were selected for use in this BERA because they are typically based on

geometric means of multiple BAFs, rather than a single study, and were derived from field studies as opposed to laboratory studies. The BAFs in Conder et al. (2020) are based on one of two laboratory studies. As discussed in Divine et al. (2020), "field data are preferred because they provide a more representative measure of uptake from all exposure routes (whereas laboratory studies typically focus on a single exposure media) and concentration of PFAS in biota in the field would be expected to have reached equilibrium with concentrations in the environment." Surrogate BAFs were used, as needed, and were selected based upon similarity of perfluorinated carbon chain length and/or functional groups.

The selected literature-based aquatic plant and aquatic invertebrate BAFs are presented in **Table 6**. Aquatic plant and aquatic invertebrates tissue concentrations were estimated by multiplying the chemical- and receptor-specific BAFs by the surface water EPCs within each exposure area.

6.2.2.2 Calculation of Potential Doses

To estimate potential dietary exposure, a TDD was estimated for each species consistent with USEPA (1997) and generally consistent with SERDP methodologies (Conder et al. 2020; Divine et al. 2020). The TDD calculation considers the following factors: concentrations of the contaminant in the food items that the species would consume, estimated amounts of surface water as drinking water, estimated amounts of abiotic media (e.g., soil, sediment) that it would be incidentally ingested, the relative amount of different food items in its diet, body weight, species-specific area use factors (AUFs), seasonal use factors (SUFs), and food ingestion rates.

The AUF is a ratio based on the size of the available habitat within the exposure area divided by an organisms' home range size. The larger the animal's home range, the smaller the AUF (less likely to forage solely in one exposure area). A SUF is defined as the fraction of the year a receptor spends within the exposure area. Since the target species were selected to be protective of entire guilds and to protect resident species as well as transient species, a default SUF of 1 was applied for all wildlife receptors regardless of potential target receptor seasonal presence. This SUF assumes the receptors are present all year and do not migrate out of the study area for the winter months (forage within the study area for their entire lifespan); this assumption may be conservative for birds that are only present for a portion of the year, but was selected due to the possible presence of species protected under the MBTA as well as all species that are present during a sensitive life stage (e.g., breeding season).

The following generalized equation was used to evaluate the TDD from each source (i.e., food item, drinking water, incidental ingestion):

$$TDD = \frac{\sum(\text{Tissue or Media Concentration} \times \text{Ingestion Rate} \times \text{AUF} \times \text{SUF})}{\text{Body Weight}}$$

This generalized equation was modified for each representative species and exposure area using the exposure parameters presented in **Table 4** and the EPCs considered in the TDD calculations are indicated below:

Area	Abiotic EPCs		Tissue EPCs (µg/kg, wet weight)					
	Sediment (µg/kg, dry weight)	Total - Surface Water (µg/L)	Aquatic Plant [1]	Aquatic Invert. [1]	Benthic Invert.	Amphibian	Forage Fish	Predatory Fish
Raleigh Creek - Upper	154	3.0	574	846	107	730	6009	NS
Raleigh Creek - Other	6.5	0.28	53.7	79.2	24.7	43.2 [2]	370	NS
Eagle Point Lake	74.5	0.32	60.4	88.9	23.3	145 [1]	2104	2466
Lake Elmo	4.5	0.19	36.1	53.3	27.8 [1]	86.7 [1]	1423	1653
West Lakeland Area	2.7	0.20	37.7	55.5	48.2	117	1032	1435

Notes
The EPC is the 95% UCL for measured data, unless otherwise noted.
NS - Not sampled.
1 - EPC is a calculated value.
2 - EPC is a maximum detected value.

6.2.3 Estimation of Effects

TRVs can be defined as the daily dose of a constituent that is considered protective of wildlife (mammals and birds) populations or individuals. The dose is expressed in milligram per kilogram body weight per day (mg/kg-bw/day) and can be based on either a NOAEL or a lowest observed adverse effects level (LOAEL).

USEPA guidance (USEPA, 1997) specifies that it is preferred that TRVs represent a NOAEL for chronic exposure to site-related constituents. Should a NOAEL not be available, USEPA guidance allows the use of the lowest exposure level shown to produce adverse effects (i.e., the LOAEL) in the development of TRVs. Both upper and lower bound TRVs (LOAEL-based TRVs and NOAEL-based TRVs, respectively) were developed for this assessment in order to estimate a range of potential risks to mammalian and avian receptors. The NOAEL-based TRVs represent non-hazardous exposure levels for the wildlife species evaluated, below which adverse effects are not expected for individuals or populations. The LOAEL-based TRVs represent potential exposure levels at which adverse effects may become evident for ecological receptor populations.

Current literature sources of TRVs was reviewed, including Conder et al. (2020), Divine et al. (2020), and Zodrow et al. (2020). The selected TRVs for birds and mammals are presented in **Tables 7 and 8**, respectively. TRVs were preferentially selected from Divine et al. (2020) and Zodrow et al. (2020) due to preference for the Ecological Soil Screening Level (Eco-SSL) TRV-derivation approach (USEPA, 2005) that was used by these sources and that Zodrow et al. (2020) is a peer reviewed journal article. As a secondary source, TRVs were selected from Conder et al. (2020) since these TRVs were based on single-study sources and include TRVs based upon PFAS mixtures. In the absence of available TRVs, surrogate TRVs were assigned based on similar chain length and class.

The selection of surrogates based on similarities in carbon chain length and structure is consistent with Conder et al. (2020), Divine et al. (2020), and Zodrow et al. (2020).

Risk estimates for wildlife receptors are defined as the ingested dose divided by the species-specific TRV:

$$HQ = TDD/TRV$$

Two types of HQs were calculated for birds and mammals using the NOAEL and LOAEL TRVs to estimate the potential for adverse effects due to PFAS. By calculating two HQs, one equal to the dose divided by the NOAEL and one equal to the dose divided by the LOAEL, a risk manager can more definitively assess risk to the typical individual and to the overall population. For the wildlife assessment endpoints evaluated using the food web model, the following general conclusions can be drawn using these three categories to describe potential ecological risk:

- If the NOAEL HQ<1, then no unacceptable risk exists to individuals or receptor populations.
- If the NOAEL HQ>1 but LOAEL HQ <1, risk is unlikely for individuals but cannot be confidently excluded. Unacceptable risks to the receptor population are unlikely.
- If the LOAEL HQ > 1, there is potential risk to the receptor population.

7.0 Risk Characterization

The results of the BERA risk analysis were analyzed and interpreted to determine the likelihood of adverse environmental effects due to PFAS exposure, and to determine whether a conclusion of no significant risk could be reached for each assessment endpoint evaluated. The ecological risk characterization summarizes the results of the risk analysis phase of work and provides interpretation of the ecological significance of the findings.

The sections below discuss the measures of effect for each receptor community (i.e., benthic invertebrates, aquatic organisms, fish, wildlife) and integrates those findings into an overall risk characterization for each exposure area. The assumptions and uncertainties that may impact the risk characterization are also discussed.

7.1 Risk Characterization for Lower Trophic Level Receptors

Potential risks to benthic and aquatic receptors from direct exposure to PFAS in surface water, sediment, and porewater were evaluated using ESV comparisons. Sample-by-sample aquatic life ESV comparisons were conducted for foam. The results and findings are provided in the sub-sections below.

7.1.1 Surface Water, Sediment and Porewater

As described in Section 6.1, maximum detected concentrations in surface water, sediment, and porewater in each area were initially screened to identify PFAS which warranted further evaluation using the UCLs. Media and area-specific UCLs were then calculated for the sub-set of PFAS requiring further evaluation in these three media. **Appendix D** identifies the UCLs and provides the supporting ProUCL documentation. **Appendix F** provides the ESV comparison tables for surface water, sediment, and porewater and **Tables 9 through 11** summarize the resulting HQs for these three media, respectively. The results of the UCL evaluations resulting in HQs above 1 are summarized below.

Area	Direct Exposure HQs > 1 using ESVs and UCLs		
	Surface Water	Sediment [1]	Porewater [2]
Raleigh Creek-Upper	PFOS (total) HQ = 5.4 PFOS (dissolved) HQ = 2.9	No benthic invertebrate HQs > 1	PFOS (dissolved) HQ = 3.5
Raleigh Creek-Other	No aquatic life HQs > 1	No benthic invertebrate HQs > 1	No aquatic life HQs > 1
Eagle Point Lake	No aquatic life HQs > 1	No benthic invertebrate HQs > 1	PFOS (dissolved) HQ = 2.0
Lake Elmo	No aquatic life HQs > 1	No benthic invertebrate HQs > 1	Not sampled
West Lakeland Area	No aquatic life HQs > 1	No benthic invertebrate HQs > 1	No aquatic life HQs > 1

Notes:

1 – A direct exposure ESV for sediment was only available for PFOS and this ESV was used as a surrogate for other long-chain PFAS. It is noted that concentrations of other PFAS were also below the PFOS ESV.

2 – Total porewater was only analyzed in three samples collected from the West Lakeland Area.

As indicated above, PFOS was the only PFAS detected in surface water and porewater above the chronic ESVs protective of aquatic life. In Raleigh Creek-Upper, total and dissolved PFOS in surface water and dissolved PFOS in porewater exceeded the chronic aquatic life ESV (represented by the HC1) and in Eagle Point Lake, dissolved PFOS in porewater exceeded the chronic aquatic life ESV. NOAEL HQs based on the PFOS surface water ESV ranged from 2.0 in Eagle Point Lake to 5.4 in Raleigh Creek-Upper. Section 7.3.5 of the uncertainty assessment provides a discussion of total versus dissolved PFAS concentrations in surface water and porewater.

These exceedances are based on the use of the conservative HC1 of 0.56 micrograms per liter (µg/L) from Conder, et al (2020) as the surface water direct toxicity ESV for PFOS. This value is derived to be protective of 99% of species and may overestimate risks to typical aquatic life species but is included in the BERA as a worst-case comparison to be protective of sensitive species. Comparisons to the PFOS HC5 value (5.85 µg/L; Conder, et al., 2020), did not identify aquatic life exceedances within Raleigh Creek or Eagle Point Lake due to surface water or porewater exposures. The HC5 is protective of 95% of species which is more representative of the methodology used to establish AWQC.

Sediment HQs were less than 1 for all PFAS in all exposure areas. Only a single sediment ESV was available so the PFOS ESV from NPCA (2008) was used as a surrogate for other long-chain PFAS. Conder et al. (2020) and Divine, et al. (2020) indicated that the available toxicity data for benthic invertebrates is lacking and insufficient to develop ESVs. However, the evaluation of porewater against aquatic life ESVs was conducted to provide an assessment for benthic invertebrates exposed to PFAS in sediment porewater. As indicated above, this evaluation only identified HQs above 1 in porewater from Raleigh Creek-Upper and Eagle Point Lake using the conservative HC1, and more emphasis is placed on use of the HC5 (for which no risk was indicated) because it reflects the level of protection afforded by USEPA's AWQC. As described in more detail Section 7.3.2, midges may be more sensitive to water exposures of PFOS (including in porewater) than other tested aquatic species and the HC5 may not be sufficiently protective of chronic impacts to the midge due to porewater exposure.

These results indicate no significant risks to typical benthic and aquatic species present within the Project 1007 waterways due to direct contact with surface water, sediment or porewater. The comparisons to the HC1 show the potential for risks to sensitive species in limited areas (Raleigh Creek-Upper and Eagle Point Lake). A review of the NHIS rare species information (MNDNR, 2021c) did not identify special status aquatic species (e.g., fish, aquatic invertebrates, benthic invertebrates, mollusks) within Raleigh Creek-Upper or Eagle Point Lake; although the least darter and pugnose shiner have each been documented in other waterbodies within the study area.

Although ESVs are not available for aquatic reptiles like water snakes or turtles, the lack of significant risks to other aquatic receptors due to direct exposure to surface water and sediments may indicate that reptiles are not likely to be at risk due to direct exposure to PFAS. To date, few PFAS toxicity studies have been conducted with reptiles and linkages between PFAS exposures and endpoints relevant to ecological risk assessments are uncertain (ITRC, 2020; Ankley, et al., 2021).

- Studies on PFOS in the Great Lakes food-web indicate concentrations in snapping turtles (and Chinook salmon and carp) are, on average, 5- to 10-fold less than those in upper trophic level birds and mammals that prey on turtles (mink and bald eagles) (Kannan et al. 2005).
- Blood plasma of snapping turtles collected from the Great Lakes region contained considerable concentrations of PFOS ranging from 105 to 169 ng/mL (mean: 137 µg/L) in males and from <1 to 8.8 µg/L (mean: 6.13 µg/L) in females. This notable gender difference in

the concentrations of PFOS in snapping turtles suggests oviparous transfer of PFOS through egg-laying, similar to that observed for birds and fish (Kannan et al. 2005).

- A study of sea turtles in the North Pacific has shown higher blood plasma concentrations of PFAS in omnivorous species compared to herbivorous species and detected PFAS in the eggs of the omnivorous hawksbill turtle (*Eretmochelys imbricata*). The study found that maternal offloading was strongest in the first clutch of the season and egg concentrations were highest in nest laid near source areas (e.g., international airports) (Wood, et al., 2021).
- PFAS were also detected in the plasma of sea turtles off the coast of North and South Carolina with concentrations showing differences by species, age, and habitat (Keller, et al., 2005).

Birds with similar dietary habits may be a reasonable potential indicator of risk to reptiles in the absence of PFAS toxicity data specific to reptiles. Since the Blanding's turtle, a state threatened species, has been observed within one-mile of the Project 1007 waterway, the findings for the omnivorous spotted sandpiper in Section 7.2 are considered relative to risks to the Blanding's turtle, which is also expected to consume a diet including invertebrates and fish (MNDNR, 2021d).

7.1.2 Foam

Foam samples have been collected at least once within each exposure area. As described in Section 4.2, foam appears intermittently within the Project 1007 waterways and may be associated with agitation of the surface water due to rapid water flows or wind and wave action. **Appendix B** includes photographs of foam observed within Raleigh Creek, Lake Elmo, and the West Lakeland Area. PFAS in foam is more highly concentrated than in nearby surface water samples (averaging over 10,000 times higher than in surface water). However, the mechanisms for ecological exposures to PFAS in foam are poorly understand and comparison of foam concentrations (approximately 90% air; Schilling and Zessner, 2011) to surface water ESVs introduces uncertainty in the risk characterization. As indicated in the photographs in **Appendix B**, the foam may be spread out along the water surface or accumulated and piled more vertically within vegetation or debris.

Appendix F provides a sample-by-sample evaluation of foam concentrations against both acute and chronic aquatic life ESVs and the results of the comparisons are summarized below.

Area	Summary of Foam Comparisons to Aquatic Life ESVs		
	Number of Samples Collected	Number of Exceedances of Chronic ESVs [1]	Number of Exceedances of Acute ESVs
Raleigh Creek-Upper	7	PFHxS = 1 sample PFHpS = 3 samples PFOS = 7 samples PFNS = 4 samples PFDS = 2 samples PFOSA = 7 samples N-MeFOSA = 2 samples N-EtFOSA = 2 samples N-MeFOSAA = 3 samples N-EtFOSAA = 7 samples	PFOS = 3 samples (maximum concentration of 13,800 µg/L; HQ = 24.2)

Area	Summary of Foam Comparisons to Aquatic Life ESVs		
	Number of Samples Collected	Number of Exceedances of Chronic ESVs [1]	Number of Exceedances of Acute ESVs
Raleigh Creek-Other	7	PFHxS = 1 sample PFHpS = 1 sample PFOS = 7 samples PFNS = 2 samples PFOSA = 3 samples N-MeFOSAA = 1 sample N-EtFOSAA = 3 samples	PFOS = 2 samples (maximum concentration of 2,750 µg/L; HQ = 4.8)
Eagle Point Lake	1	PFOS = 1 sample	None
Lake Elmo	3	PFOS = 3 samples PFOSA = 2 samples N-EtFOSAA = 3 samples	PFOS = 2 samples (maximum concentration of 904 µg/L; HQ = 1.6)
West Lakeland Area	4	PFHpS = 2 samples PFOS = 4 samples PFOSA = 3 samples N-EtFOSAA = 3 samples	PFOS = 2 samples (maximum concentration of 20,700 µg/L; HQ = 36.3)

Notes:

1 – PFOS HC1 screening value of 0.56 µg/L was used as a surrogate to evaluate the other long-chain sulfonic PFAS listed in this table (which did not have PFAS-specific ESVs). This chronic benchmark is protective of 99% of species and it expected to overestimate risks to typical aquatic life species, particularly for short duration foam exposures.

As indicated above, PFOS in all samples exceeded the chronic aquatic life ESV (i.e., the conservative HC1) and nine of the 22 samples also had PFOS concentrations above the acute aquatic life ESV. Several additional PFAS constituents also exceeded the PFOS chronic ESV (used as a surrogate for PFAS without specific ESVs). Concentrations of PFHpS, PFOS, PFNS, PFOSA, N-EtFOSA, N-EtFOSAA also exceeded the PFOS HC5 which is deemed by USEPA to provide an appropriate level of protection to the majority of aquatic species likely to be present in a common surface water body (USEPA, 2010).

Applying surface water screening levels to foam samples is considered to be a conservative approach, as the foam is comprised of air and water and is not an entirely aqueous-exposure medium. Direct contact exposures to the foam by aquatic plants, fish, reptiles, amphibians, and invertebrates are considered. It is expected that most foam exposures are relatively short in duration which would likely limit the potential for long-term chronic impacts on aquatic life, except possibly in areas where the foam occurs more frequently and where PFAS may be present in higher concentrations in nearby sediment and plants.

It is not clear that the acute or chronic ESVs are necessarily applicable to evaluating the exposure of aquatic receptors to foam which is composed of a mixture primarily comprised of air with water and organic materials. Due to the relatively short-term nature of the presence of the foam, the chronic ESVs likely overestimate risks (particularly the HC1 value which is exceeded in all foam samples; see **Appendix F**) and acute ESVs are more applicable to evaluating these exposures.

The most significant exposures to foam may occur for aquatic organisms residing on the water surface (e.g., various species of freshwater aquatic insects) and within the sediment porewater of the banks where foam has been observed to intermittently accumulate. Aquatic organisms such as fish and tadpoles are not expected to typically be in direct contact with the foam but may be exposed to elevated PFAS levels when the foam dissipates back into the water.

Wildlife are not likely to be adversely affected by foam via direct contact (due to the presence of fur, feathers, and scales) and foam is not expected to be a bioaccumulation concern due to the relatively short duration of foam occurrences within a particular area. Ingestion of foam during feeding, preening, or drinking could occur but these would likely be infrequent exposures of short durations and are not comparable to ESVs based on chronic exposures via bioaccumulation. Therefore, foam concentrations were not compared against wildlife ESVs which are based on exposures via bioaccumulation. Uncertainties associated with potential exposures of wildlife to foam are discussed in Section 7.3.4.

The results of the screening indicate the potential for risks to aquatic organisms due to exposure to foam. It is expected that chronic risks are overestimated by the ESVs (as the foam exposure are typically short-term), but acute risks due to PFOS in foam may occur within a sub-set of locations with the highest foam concentrations. These locations include RC5, RC7, and RC12 in Raleigh Creek-Upper, RC17 and RC17A in Raleigh Creek-Other, EP21B in Lake Elmo, and WL6 in the West Lakeland Area. Most of these exceedances occurred in samples collected in late summer/early fall, rather than in samples collected in the spring, so there may be a seasonal component to the development of the most PFAS-concentrated foam.

Given that the least darter (state fish of special status) and the pugnose shiner (state threatened species) have been observed within the Project 1007 waterways, foam could pose a risk to these special status species if they have direct interaction with the foam. In Minnesota, least darters are usually found in low-velocity streams with cool to warm waters that are part of a connected lake or stream system. The darters may also be associated with waterbodies that have dense, submerged, aquatic vegetation (MNDNR, 2021e). The pugnose shiner inhabits clear glacial lakes and low gradient small-to-moderate-sized streams in areas of little current. In summer they tend to move shoreward into vegetated areas and move into deeper waters for the fall and winter (MNDNR, 2021f). The presence of foam within these types of habitats may be a concern for these two listed species.

7.2 Vertebrate Wildlife Community Risk Characterization

Based on the fate and transport characteristics of PFAS and the findings of the SLERA, wildlife ingestion exposure pathways represent the highest potential for ecological risk within the Project 1007 aquatic habitats. As recommended in the Work Plan (AECOM, 2020b), surface water and sediment data were evaluated relative to wildlife ESVs to confirm the findings of the SLERA screening which identified wildlife ESV exceedances for PFOA and PFOS. Porewater data were not evaluated in the SLERA, but porewater data were compared to the wildlife ESVs in the BERA to assess the potential for bioaccumulation of PFAS into sediment-dwelling biota to impact birds and mammals.

Sediment and surface water ESVs protective of wildlife consuming contaminated prey were derived by Divine et al. (2020) using a NOAEL-based food web model and back-calculating an acceptable surface water or sediment concentration. The wildlife ESV comparison tables for surface water, sediment, and porewater are included in **Appendix F** and **Tables 9 through 11** summarize the resulting HQs for these media, respectively. The lowest of the available wildlife ESVs was used for

the ESV comparisons so these evaluations are protective of a range of feeding guilds. The results of the UCL evaluations resulting in wildlife-based HQs above 1 are summarized below.

Area	Wildlife Exposure NOAEL-based HQs > 1 using ESVs and UCLs		
	Surface Water	Sediment	Porewater [1]
Raleigh Creek-Upper	PFHxS (total) HQ = 1.2 [2] PFOS (total) HQ = 40.5 PFOS (dissolved) HQ = 21.5	PFOA HQ = 1.1 PFHpS HQ = 2.3 [3] PFOS HQ = 110 PFOSA HQ = 6.2 [3] N-EtFOSAA HQ = 4.1 [3]	PFOS (dissolved) HQ = 26.1
Raleigh Creek-Other	PFOS (total) HQ = 3.8	PFOS HQ = 4.6	No wildlife HQs > 1
Eagle Point Lake	PFOS (total) HQ = 4.3 PFOS (dissolved) HQ = 6.3	PFOS HQ = 53.2	PFOS (dissolved) HQ = 15.2
Lake Elmo	PFOS (total) HQ = 2.5 PFOS (dissolved) HQ = 4.8	PFOS HQ = 3.2	Not sampled
West Lakeland Area	PFOS (total) HQ = 2.7 PFOS (dissolved) HQ = 3.3	PFOS HQ = 1.9	PFOS (total) HQ = 2.9 PFOS (dissolved) HQ = 7.5
Notes: 1 – Total porewater was only analyzed in three samples collected from the West Lakeland Area. 2 - PFOS wildlife ESV of 0.075 µg/L was used as a surrogate to evaluate these PFAS which did not have PFAS-specific ESVs. 3 - PFOS wildlife ESV of 1.4 µg/kg was used as a surrogate to evaluate these PFAS which did not have PFAS-specific ESVs.			

As indicated above, PFOS exceeded the wildlife-based ESVs in surface water and sediment in all exposure areas. PFOS in porewater also exceeded the wildlife ESV in Raleigh Creek-Upper, Eagle Point Lake, and West Lakeland Area. PFOA slightly exceeded the wildlife ESV in sediment in Raleigh Creek-Upper. Surrogates were applied to evaluate PFAS without wildlife ESVs in Divine et al. (2020), and several PFAS in Raleigh Creek-Upper exceeded the PFOS wildlife ESVs in surface water (PFHxS) and sediment (PFHpS, PFOSA, and N-EtFOSAA). These results essentially confirmed the results of the SLERA which indicated that PFOS, and to a lesser extent PFOA, within Project 1007 waterways may pose a risk to wildlife. The SLERA had not used surrogates but would have identified additional PFAS with exceedances if it had.

The need for further evaluation of the potential for adverse effects on wildlife receptors is also confirmed by comparing the available tissue concentrations to tissue-based Federal Environmental Quality Guidelines (FEQGs) for PFOS derived by Environment and Climate Change Canada (ECCC 2018). ECCC derived FEQGs for tissue based on dietary ingestion for both birds and mammals (units of µg PFOS per kg fish tissue). These FEQGs for wildlife diet (8.2 and 4.6 µg/kg for birds and mammals, respectively) were derived to protect species that consume aquatic biota and represent the PFOS concentration in a food item (i.e., fish or shellfish) that could be consumed by wildlife. PFOS concentrations in nearly all of the site-specific tissues summarized in Section 4.3, with the exception of a few samples from Raleigh Creek-Other, exceed the tissue-based FEQGs; in many cases by orders of magnitude (maximum fish tissue PFOS concentration was 6,350 µg/kg). Like the sediment and surface water ESVs protective of wildlife derived by Divine et al. (2020), the tissue-based FEQGs are based on generic receptors and uptake factors and toxicity data available in the literature at the time and are intended to represent a conservative assessment of the potential for risks to wildlife. These exceedances confirm the findings of the screening conducted using wildlife-based ESVs in surface

water and sediment (summarized in the table above) and indicate that additional evaluation is warranted to further assess the potential for risks to wildlife using more site-specific information and more current toxicity data.

As described in Section 6.2, deterministic food web models were used to quantitatively evaluate the potential for risks to wildlife within each exposure area using the abiotic data evaluated in the ESV comparisons and the tissue data collected during the BERA sampling event. Although the wildlife ESV comparisons summarized above only identified a short list of PFAS exceeding the ESVs, each food web model included all of the PFAS that were detected in more than one area-specific tissue sample. This approach was selected to provide a comprehensive evaluation of the relevant PFAS in each area.

A TDD was calculated for each wildlife receptor in each exposure area using the EPC (i.e., the maximum concentration or the UCL) for surface water, sediment and food items. The estimated TDD was compared to NOAEL- and LOAEL-based TRVs. The results of these comparisons (i.e., HQs) are summarized below. Note, only HQs greater than 1 are shown in the table. The individual food web models are provided in **Appendices G through K** and **Table 12** summarizes the resulting HQs within each exposure area. PFOS was the only PFAS resulting in HQs above 1 for wildlife. The avian and mammalian receptors with PFOS HQs above 1 are summarized below and discussed by area in the following sub-sections.

Receptor	Food Web Model Hazard Quotients > 1				
	Raleigh Creek-Upper	**Raleigh Creek-Other**	**Eagle Point Lake**	**Lake Elmo**	**West Lakeland Area**
Tree Swallow	PFOS NOAEL HQ = 1.5	None	PFOS NOAEL HQ = 1.2	None	None
Spotted Sandpiper	PFOS NOAEL HQ = 3.6	None	None	None	None
Great Blue Heron	PFOS NOAEL HQ = 11.1 PFOS LOAEL HQ = 1.1	None	PFOS NOAEL HQ = 3.9	PFOS NOAEL HQ = 2.6	PFOS NOAEL HQ = 1.9
Muskrat	PFOS NOAEL HQ = 1.9 PFOS LOAEL HQ = 1.1	None	None	None	None
Little Brown Bat	PFOS NOAEL HQ = 1.4	None	None	None	None
Mink	Not evaluated	Not evaluated	PFOS NOAEL HQ = 2.7 PFOS LOAEL HQ = 1.6	PFOS NOAEL HQ = 1.8 PFOS LOAEL HQ = 1.1	PFOS NOAEL HQ = 1.5

The wildlife-based HQs resulting from the area-specific food web models are lower than the HQs based on the literature value (i.e., wildlife ESV) comparisons for surface water, sediment, and porewater. For PFOS, the maximum HQ for the wildlife ESV comparisons was 110 and the maximum site-specific food web model HQ was 11. This result is not unexpected as the wildlife ESVs were selected based on the most conservative of the wildlife receptors modeled by Divine, et al. (2020)

and are intended to represent a conservative assessment of the potential for risks to wildlife. The food web based HQs are derived from actual measured tissue concentrations (with the exception of aquatic plants and aquatic invertebrates) and are expected to more accurately reflect the potential area-specific risks.

7.2.1 Raleigh Creek

Appendices G and H present the food web models for Raleigh Creek-Upper and Raleigh Creek-Other, respectively. Raleigh Creek was divided into two exposure areas due to the differences in concentrations of PFAS between the areas. As examples, the PFOS EPCs for forage fish and sediment were 16 times higher and 24 times higher in the upper portion of the creek than the remainder of the creek, respectively.

Wildlife receptors in both exposure areas were the same and included: wood duck, tree swallow, spotted sandpiper, great blue heron, muskrat, little brown bat, and raccoon. All HQs for Raleigh Creek-Other were less than 1 (**Table 12a**). HQs greater than 1 were calculated for PFOS for five receptors in Raleigh Creek-Upper: tree swallow, spotted sandpiper, great blue heron, muskrat, and little brown bat (**Table 12b**). These receptors are discussed below.

Tree swallow (diet: aquatic plants and benthic and aquatic invertebrates) - Only the NOAEL-based HQ for PFOS was above 1 (HQ = 1.5) for the tree swallow in Raleigh Creek-Upper. The majority of the PFOS TDD came from the ingestion of aquatic invertebrates. Aquatic invertebrate concentrations were estimated from surface water concentrations using a literature-based BAF. The calculated aquatic invertebrate EPC was about eight times higher than the measured crayfish EPC which may indicate that aquatic invertebrate concentrations are overestimated. It would be expected that aquatic invertebrates, such as the larval stages of midges, mayflies, and other flies that have shorter aquatic life cycles than crayfish (less time to accumulate PFOS), should have lower PFOS concentrations than crayfish. If the aquatic invertebrate EPC was set equal to the measured benthic invertebrate (crayfish) EPC, the HQs for the tree swallow would be below 1. Custer et al (2019) found no impact on hatching success for tree swallows in Michigan with dietary concentrations ranging between 105 and 183 µg/kg and a geometric mean of 138 µg/kg PFOS; the crayfish EPC in Raleigh Creek-Upper is 107 µg/kg PFOS. Previous work by the same authors in Minnesota (Custer, et al., 2013) found hatching success to be impacted at lower dietary concentrations (approximately 20 to 70 µg/kg total PFAS); however, hatching success may have been impacted by the presence of co-contaminants (Ankley, et al., 2021).

Spotted sandpiper (diet: benthic and aquatic invertebrates and forage fish) - Only the NOAEL-based HQ for PFOS was above 1 (HQ = 3.6) for the spotted sandpiper in Raleigh Creek-Upper. The majority of the PFOS TDD came from the ingestion of forage fish which only account for 5% of the diet. This finding is due to the elevated PFOS concentrations in forage fish in the upper portion of Raleigh Creek. Benthic invertebrates represent 80% of the modeled diet for the sandpiper and measured crayfish concentrations were used in the food web model to represent this prey item. PFOS data for two snail composite samples were also available in this exposure area with concentrations below the crayfish EPC. Crayfish are higher in the food chain than other benthic invertebrates consumed by the sandpiper (e.g., snails, leeches, worms, mollusks) so the use of crayfish data may over-estimate actual PFOS exposure through the ingestion of benthic invertebrates. As described above for the tree swallow, the aquatic invertebrate EPC was estimated from surface water concentrations using a BAF and the calculated aquatic invertebrate EPC was about eight times higher than the measured crayfish EPC. Although the EPCs for benthic invertebrates (i.e., crayfish) and aquatic invertebrate may over-estimate risks to

the sandpiper, the forage fish EPC is the driver for calculating the NOAEL-based HQ above 1 for PFOS.

Great blue heron (diet: benthic invertebrates, amphibians, and forage fish) – The NOAEL- and LOAEL based HQ for PFOS were above 1 (HQ = 11.1 and 1.1, respectively) for the great blue heron in Raleigh Creek-Upper. Almost all of the PFOS TDD came from the ingestion of forage fish which account for 80% of the diet. The forage fish EPC, as well as the benthic invertebrate and amphibian EPCs, within Raleigh Creek-Upper are based on measured tissue concentrations and reflect actual biota concentrations in this portion of Raleigh Creek.

Muskrat (diet: aquatic plants and benthic and aquatic invertebrates) – The NOAEL- and LOAEL based HQs for PFOS were above 1 (HQ = 1.9 and 1.1, respectively) for the muskrat in Raleigh Creek-Upper. The majority of the PFOS TDD is attributed to the ingestion of aquatic plants which account for 80% of the diet. The aquatic plant EPC for PFOS is calculated from surface water and a BAF from Divine et al (2020) based on studies conducted with floating aquatic plants (i.e., duckweed, water hyacinth, floating aquatic ferns, and coontail). Divine et al (2020) also derived BSAFs for aquatic plants based on studies with bulrushes and other reeds. Muskrats may also feed on these rooted semi-aquatic wetland plants. If the PFOS BSAF and the sediment EPC are used to calculate the plant tissue EPC, the estimated concentration is higher than was estimated with the aquatic plant BAF and surface water (3,551 vs 574 µg/kg wet weight [ww]) and the NOAEL- and LOAEL- based HQs for the muskrat increase to 10 and 5.9, respectively. As described above for the tree swallow, the benthic invertebrate EPC is based on crayfish data and the aquatic invertebrate EPC is a calculated concentration. Although the EPCs for benthic invertebrates (i.e., crayfish) and aquatic invertebrates may over-estimate risks to the muskrat, the plant tissue EPC is the driver for calculating HQs above 1 for PFOS. However, given the differences in estimated plant tissue concentrations using BAFs and BSAFs, there is some uncertainty in the level of potential risk to the muskrat.

Little brown bat (diet: aquatic invertebrates) – Only the NOAEL-based HQ for PFOS was above 1 (HQ = 1.4) for the little brown bat in Raleigh Creek-Upper. The entire modeled diet of the little brown bat is composed of aquatic invertebrates with the EPC calculated from surface water. As described above for the tree swallow, the modeled aquatic invertebrate EPC may over-estimate actual concentrations in aquatic invertebrates, particularly in the aerial insects that are the basis of the diet for the little brown bat and the tree swallow. The modeled PFOS concentration for aquatic invertebrates (846 µg/kg) is approximately eight times higher than the actual measured crayfish concentrations in this exposure area (107 µg/kg) and given the residence time of aerial insects in the system and the higher trophic status of crayfish in the system, aerial insect concentrations would likely be lower than crayfish. If the measured crayfish EPC is used to represent the aerial insect tissue concentration, the NOAEL-based HQ for PFOS is 0.17.

The LOAEL-based HQs above 1 for the great blue heron and muskrat indicate the potential for population-level risks due to food web exposures to PFOS for piscivorous birds and herbivorous mammals that feed entirely within Raleigh Creek-Upper (AUFs = 1 for both receptors). Risks to the muskrat would be higher if plant tissue concentrations were estimated from sediment instead of surface water. For the tree swallow, spotted sandpiper and the little brown bat, the NOAEL-based HQs for PFOS were above 1 (HQ = 1.5, 3.6 and 1.4, respectively), but the LOAEL-based HQs were less than 1 indicating that unacceptable risks to receptor populations are unlikely, but risks to individuals cannot be confidently excluded.

Threatened or endangered birds and mammals have not been documented within one-mile of Raleigh Creek-Upper (MNDNR, 2021c), so protection at the population level is expected to be the most relevant for this area.

The Forster's tern, a state bird of special status, was documented slightly more than one-mile from Raleigh Creek-Upper in 1994 (MNDNR, 2021c) and the wetlands within Raleigh Creek-Upper may provide habitat for foraging; therefore, it is possible that Forster's terns could be present and exposed to elevated PFOS concentrations in forage fish. The tern prefers to forage in deeper, open portions of wetlands (MNDNR, 2021e) which may be present in some segments of Raleigh Creek-Upper. As indicated by the NOAEL-based HQ for PFOS above 1 for the great blue heron (HQ = 11.1), sensitive piscivorous birds such as the Forster's tern that warrant protection at the individual-level, may be adversely affected by PFOS if they forage within Raleigh Creek-Upper.

It is possible that the federally-threatened northern long-eared bat could occasionally forage within Raleigh Creek-Upper given that the IPaC review identified the species as potentially occurring within the BERA study area. However, the NHIS (MNDNR, 2021c) did not identify observations of the species within a mile of the of the Project 1007 waterways (**Table 1**). MNDNR (2021b) did not identify winter hibernacula or maternal roost trees near the waterways; no roost trees were identified within Washington County and the nearest hibernacula is at least 10 miles from the waterways. If resident bats were present, protection at the individual level (rather than the population level) would generally be warranted; however, this does not appear to be the case within the Project 1007 waterways. The NOAEL-based HQ for PFOS of 1.4 for the little brown bat indicates the low potential for risk to individuals if they foraged regularly in Raleigh Creek-Upper. However, as noted above, this HQ is based on modeled not measured tissue that is expected to over-estimate PFOS concentrations in the prey of the bat and the bats have not been documented within the BERA study area.

As indicated in Section 7.1.1, PFAS toxicity information for reptiles is very limited, but the evaluation of potential risks to birds may be useful for assessing potential risk to reptiles such as the Blanding's turtle, a state threatened species that has been observed within one-mile of the Project 1007 waterway. The Blanding's turtle may be found in a variety of wetland and aquatic habitats and may nest in adjacent sandy uplands or agricultural fields (MNDNR, 2021d). NHIS (MNDNR, 2021c) noted four observations of the Blanding's turtle within one-mile of the waterways, although none were seen in Raleigh Creek itself and all observations were made in the 1990s.

Based on generally similar diets of invertebrates and small fish, the findings for the spotted sandpiper are considered to be reasonably representative of risks to the Blanding's turtle in Raleigh Creek. NOAEL-based HQs for PFOS for the spotted sandpiper were 0.35 in Raleigh Creek-Other and 3.6 in Raleigh-Creek-Upper. As described above, the majority of the sandpiper TDD in Raleigh-Creek-Upper is from forage fish ingestion; a mixed diet of invertebrates or invertebrates and amphibians, which may be more reflective of the turtle diet, would result in NOAEL-based HQs below 1 within both Raleigh Creek-Other and Raleigh Creek-Upper. There is uncertainty in the use of avian toxicity data to assess risks to reptiles, but these HQs indicate the potential for adverse effects on Blanding's turtles if they were to consume forage fish from Raleigh Creek-Upper.

7.2.2 Eagle Point Lake

Appendix I presents the food web model for Eagle Point Lake which included the following receptors: wood duck, tree swallow, spotted sandpiper, great blue heron, bald eagle, muskrat, little brown bat, mink, and river otter. HQs greater than 1 were calculated for PFOS for three receptors in Eagle Point Lake: tree swallow, great blue heron, and mink (**Table 12c**). These receptors are discussed below.

Tree swallow (diet: aquatic plants and benthic and aquatic invertebrates) - Only the NOAEL-based HQ for PFOS was above 1 (HQ = 1.2) for the tree swallow in Eagle Point Lake. The majority of the PFOS TDD came from the ingestion of aquatic invertebrates. As described for the tree swallow in Raleigh Creek-Upper, the aquatic invertebrate concentrations were estimated from surface water concentrations using a literature-based BAF. In Eagle Point Lake, the calculated aquatic invertebrate EPC was nearly four times higher than the measured crayfish EPC which may indicate that aquatic invertebrate concentrations are overestimated. It would be expected that aquatic invertebrates (e.g., larval stages of midges, mayflies, and other flies) that have shorter aquatic life cycles than crayfish (less time to accumulate PFOS), should have lower PFOS concentrations than crayfish. If the aquatic invertebrate EPC was set equal to the measured benthic invertebrate (crayfish) EPC, the HQs for the tree swallow would be below 1. Additionally, the crayfish EPC for PFOS in Eagle Point Lake of 23.3 µg/kg is less than the dietary concentration of 138 µg/kg presented in Custer et al. (2019; discussed above for Raleigh Creek-Upper), i.e., concentration at which tree swallow hatching success was not adversely affected. This crayfish EPC is at the low end of the dietary range where hatching success was impacted in sites with co-contaminants (20 to 70 µg/kg total PFAS; Custer, et al., 2013; Ankley, et al., 2021).

Great blue heron (diet: benthic invertebrates, amphibians, and forage fish) – Only the NOAEL-based HQ for PFOS was above 1 (HQ = 3.9) for the great blue heron in Eagle Point Lake. The majority of the PFOS TDD came from the ingestion of forage fish which account for 80% of the diet. The forage fish EPC, as well as the benthic invertebrate EPC, are based on measured tissue concentrations and reflect actual biota concentrations in Eagle Point Lake. The amphibian EPC was calculated from surface water using a Project 1007-specific BAF based on amphibian and surface water data from other exposure areas. Forage fish account for nearly all of the PFOS TDD, so the impact of the benthic invertebrate and amphibian EPCs on the NOAEL-based HQ is minimal.

Mink (diet: benthic and invertebrates, amphibians, forage fish, and aquatic plants) – The NOAEL- and LOAEL based HQ for PFOS were above 1 (HQ = 2.7 and 1.6, respectively) for the mink in Eagle Point Lake. The majority of the PFOS TDD came from the ingestion of forage fish and predator fish which account for 70% of the diet. The mink is also assumed to consume benthic invertebrates, aquatic invertebrates, plants, and amphibians, but the impact of these EPCs on the HQs in minimal. The forage fish and predator fish EPCs are similar (2,104 vs 2,466 µg/kg ww, respectively) and are based on measured tissue concentrations and reflect actual biota concentrations in Eagle Point Lake.

The LOAEL-based HQ above 1 for the mink indicates the potential for population-level risks due to food web exposures to PFOS for piscivorous mammals that feed entirely within Eagle Point Lake (AUF = 1). For the great blue heron, the NOAEL-based HQ for PFOS was above 1 (HQ = 3.9), but the LOAEL-based HQ was less than 1 indicating that unacceptable risks to receptor populations are unlikely, but risks to individuals cannot be confidently excluded. Threatened or endangered birds and mammals have not been documented within one-mile of Eagle Point Lake (MNDNR, 2021c), so protection at the population level is the most relevant for this area.

One observation of the Blanding's turtle occurred within one-mile of Eagle Point Lake (MNDNR, 2021c) and wetland habitat is present surrounding the lake. All HQs for the spotted sandpiper are less than 1 and a mixed diet of invertebrates or invertebrates and amphibians would result in even lower HQs. Although there are uncertainties in the assessment, the low sandpiper HQs suggest that Blanding's turtles, if present, would not be adversely impacted by PFOS in Eagle Point Lake.

As indicated above for the muskrat in Raleigh Creek-Upper and discussed further in Section 7.3.3, the prediction of plant tissue concentrations from surface water data may underestimate actual PFOS concentrations in plants. If the PFOS concentration in plant tissue was modeled from sediment, rather that surface water, then the muskrat in Eagle Point Lake would have a LOAEL-based PFOS HQ of 2.8, indicating the potential for population-level risks.

7.2.3 Lake Elmo

Appendix J presents the food web model for Lake Elmo which included the following receptors: wood duck, tree swallow, spotted sandpiper, great blue heron, bald eagle, muskrat, little brown bat, mink, and river otter. HQs greater than 1 were calculated for PFOS for two receptors in Lake Elmo: great blue heron and mink (**Table 12d**). The findings for Lake Elmo are very similar to the findings for Eagle Point Lake and the Lake Elmo receptors with HQs greater than 1 are discussed below.

> **Great blue heron** (diet: benthic invertebrates, amphibians, and forage fish) – Only the NOAEL-based HQ for PFOS was above 1 (HQ = 2.6) for the great blue heron in Lake Elmo. The majority of the PFOS TDD came from the ingestion of forage fish which account for 80% of the diet. The forage fish EPC is based on measured tissue concentrations and reflects actual biota concentrations in Lake Elmo. The benthic invertebrate and amphibian EPCs were calculated from surface water using Project 1007-specific BAFs based on tissue (crayfish and amphibian, respectively) and surface water data from other exposure areas. Forage fish account for nearly all of the PFOS TDD, so the impact of the benthic invertebrate and amphibian EPCs on the NOAEL-based HQ is minimal.
>
> **Mink** (diet: benthic and invertebrates, amphibians, forage fish, and aquatic plants) – The NOAEL- and LOAEL based HQ for PFOS were above 1 (HQ = 1.8 and 1.1, respectively) for the mink in Lake Elmo. The majority of the PFOS TDD came from the ingestion of forage fish and predator fish which account for 70% of the diet. The mink is also assumed to consume benthic invertebrates, aquatic invertebrates, plants, and amphibians, but the impact of these EPCs on the HQs in minimal. The forage fish and predator fish EPCs are similar (1,423 vs 1,653 µg/kg ww, respectively) and are based on measured tissue concentrations and reflect actual biota concentrations in Lake Elmo.

The LOAEL-based HQ above 1 for the mink indicates the potential for population-level risks due to food web exposures to PFOS for piscivorous mammals that feed entirely within Lake Elmo (AUF = 1). For the great blue heron, the NOAEL-based HQ for PFOS was above 1 (HQ = 2.6), but the LOAEL-based HQ was less than 1 indicating that unacceptable risks to receptor populations are unlikely, but risks to individuals cannot be confidently excluded. Threatened or endangered birds and mammals have not been documented within one-mile of Lake Elmo (MNDNR, 2021c), so protection at the population level is the most relevant for this area.

Similar to Eagle Point Lake, one observation of the Blanding's turtle occurred within one-mile of Lake Elmo (MNDNR, 2021c) and wetland habitat is present surrounding the lake. All HQs for the spotted sandpiper are less than 1 and a mixed diet of invertebrates or invertebrates and amphibians would result in even lower HQs. Although there are uncertainties in the assessment, the low sandpiper HQs suggest that Blanding's turtles, if present, would not be adversely impacted by PFOS in Lake Elmo.

7.2.4 West Lakeland Area

Appendix K presents the food web model for the West Lakeland Area which included the following receptors: wood duck, tree swallow, spotted sandpiper, great blue heron, muskrat, little brown bat,

mink, and river otter. HQs greater than 1 were calculated for PFOS for two receptors in the West Lakeland Area: great blue heron and mink (**Table 12e**). These receptors are discussed below.

> **Great blue heron** (diet: benthic invertebrates, amphibians, and forage fish) – Only the NOAEL-based HQ for PFOS was above 1 (HQ = 1.9) for the great blue heron in the West Lakeland Area. The majority of the PFOS TDD came from the ingestion of forage fish which account for 80% of the diet. The forage fish EPC, as well as the benthic invertebrate and amphibian EPCs, are based on measured tissue concentrations and reflect actual biota concentrations in the West Lakeland Area. Forage fish account for nearly all of the PFOS TDD, so the impact of the benthic invertebrate and amphibian EPCs on the NOAEL-based HQ is minimal.
>
> **Mink** (diet: benthic and invertebrates, amphibians, forage fish, and aquatic plants) – Only the NOAEL-based HQ for PFOS was above 1 (HQ = 1.5) for the mink in the West Lakeland Area. The majority of the PFOS TDD came from the ingestion of forage fish and predator fish which account for 70% of the diet. The mink is also assumed to consume benthic invertebrates, aquatic invertebrates, plants, and amphibians, but the impact of these EPCs on the HQs in minimal. The forage fish and predator fish EPCs are similar (1,032 vs 1,435 µg/kg ww, respectively) and are based on measured tissue concentrations and reflect actual biota concentrations in the West Lakeland Area.

None of the LOAEL-based HQs in the West Lakeland Area were above 1 which indicates that population-level risks due to food web exposures are unlikely. For the great blue heron and the mink, the NOAEL-based HQs for PFOS were above 1 (HQ = 1.9 and 1.5, respectively), but the LOAEL-based HQs were less than 1 indicating that unacceptable risks to receptor populations are unlikely, but risks to individuals cannot be confidently excluded. Threatened or endangered birds and mammals have not been documented within one-mile of the West Lakeland Area (MNDNR, 2021c), so protection at the population level is the most relevant.

One observation of the Blanding's turtle occurred within one-mile of the West Lakeland Area (MNDNR, 2021c) and wetland habitat is present within this area. All HQs for the spotted sandpiper are less than 1 and a mixed diet of invertebrates or invertebrates and amphibians would result in even lower HQs. Although there are uncertainties in the assessment, the low sandpiper HQs suggest that Blanding's turtles, if present, would not be adversely impacted by PFOS in the West Lakeland Area.

7.3 Uncertainties

The objective of the uncertainty analysis is to discuss the assumptions of the BERA process that may influence the risk assessment results and conclusions. Although it is not practical to account for all sources of uncertainty, it is important to identify and address the major elements of uncertainty in the risk evaluation and assessment. Some uncertainties bias the results of the risk assessment towards excessive risk (high), while others bias towards no significant risk (low).

7.3.1 Uncertainties Associated with Site Characterization

The BERA considers abiotic data collected over multiple sampling events in 2019 and 2020 and tissue data collected in September 2020. Samples were collected throughout Raleigh Creek, Eagle Point Lake, Lake Elmo, and the West Lakeland Area. While not every portion of every exposure area has been characterized, it is anticipated that the available abiotic data is representative of conditions through most of the Project 1007 waterways that provide ecological habitat, with focus on potential

source areas or secondary source areas as well as downgradient areas that may have been impacted.

Biological samples were collected in the fall and certain tissue types (e.g., aerial insects and aquatic invertebrates) were not available to be sampled. The food web model used benthic invertebrates (i.e., crayfish) or modeled invertebrate concentrations from surface water to represent prey items for consumers of invertebrates (e.g., the spotted sandpiper, tree swallow, and little brown bat). As indicated in Section 7.2, the modeled aquatic invertebrate EPC for PFOS used to represent aquatic invertebrates and aerial insects in the diet of the spotted sandpiper, tree swallow, and little brown bat in Raleigh Creek-Upper is eight times higher than the measured crayfish EPC from the area, and in Eagle Point Lake the modeled aquatic invertebrate EPC for PFOS is approximately four times higher than the measured crayfish EPC from the area. A similar relationship between these tissue compartments is observed for Raleigh Creek-Other and the West Lakeland Area (crayfish were not collected from Lake Elmo). Given the higher trophic status of the crayfish (relative to aerial insects and aquatic invertebrates) and the longer aquatic lifecycle of the crayfish, crayfish concentrations would likely be higher than aquatic invertebrate concentrations. In addition, at metamorphosis larval insects shed a portion of their body burden for contaminants like metals and polycyclic aromatic hydrocarbons (PAHs) through the loss of their exoskeleton or via excrement, while more lipophilic contaminants like polychlorinated biphenyls (PCBs) may be retained by the adult insect (Kraus, et al., 2014). Although PFAS-specific information related to body burden changes at metamorphosis is not available, PFAS are not lipophilic like PCBs and body burdens may be reduced in the adult aerial insects consumed by swallows and bats. It is expected that these surrogate tissues in the food web model (modeled aquatic invertebrates) are likely to over-estimate concentrations in aerial insects and over-estimate risks to receptors like the spotted sandpiper, tree swallow and little brown bat, but field sampling for aquatic invertebrates or aerial insects would be needed to confirm this assumption.

In addition, the literature-based plant BAFs that were used to estimate dietary tissue concentrations to assess the potential for risk to herbivorous receptors (primarily the muskrat and wood duck) introduce uncertainty, as plant uptake of PFAS is highly dependent on site-specific conditions, including the types of plant species present (Divine et al. 2020). These literature-based plant BAFs may over- or under-predict aquatic plant tissue concentrations, and hence TDD, to herbivores. Field sampling for vegetation could reduce this uncertainty by providing site-specific tissue data.

Sample counts for some tissue types in some areas (e.g., amphibians in the West Lakeland Area, crayfish in Raleigh Creek-Upper) were below the target of eight samples for the calculation of a UCL. In these cases, the ProUCL results were reviewed to determine whether the selected UCL was reasonable to use in place of the maximum detected concentration. Typically, in cases where five or more samples were available and most of the results were detected concentrations, the UCL was deemed to be acceptable for use in the food web model. The UCL, rather than the maximum, is typically preferred in a BERA to represent the EPC, particularly for foraging wildlife. The use of the maximum, rather than the UCL would increase the associated HQs slightly but would not change the overall conclusions within any of the exposure areas.

7.3.2 Uncertainties Associated with ESVs and TRVs

As an emerging contaminant, there are uncertainties associated with the evaluation of PFAS ecological risks that are currently being addressed as the science advances. ESVs and TRVs were generally selected from recent SERDP guidance documents (Conder et al. 2020, Divine et al. 2020) and a peer-reviewed supporting paper (Zodrow et al. 2020).

The lowest of the aquatic life and wildlife-based ESVs were conservatively selected for screening purposes. Exceedances of these values (e.g., the HC1 for direct toxicity to aquatic life or the most conservative wildlife-based ESV) are likely to overestimate potential risks, as evidenced by the lower HQs calculated in the area-specific food web models. The HC1 values for PFOS and PFOA (0.56 and 537 µg/L) derived by Conder et al. (2020) are particularly conservative relative to the Conder et al. (2020) HC5 values (5.85 and 1,112 µg/L, respectively), the chronic RBSLs derived by Divine et al (2020; 51 and 3,900 µg/L, respectively) and chronic aquatic life criteria derived by Giesy et al (2010; 5.1 and 2,900 µg/L, respectively).

Only a single sediment ESV was identified for use in the BERA. This lack of sediment toxicity information represents a potential source of uncertainty. However, this uncertainty was addressed by collecting sediment porewater and comparing those results to surface water ESVs. It is assumed that the surface water ESVs would be protective of benthic invertebrates living in the sediment and exposed to PFAS associated with the sediment porewater. The surface water ESVs for PFOA and PFOS were HC1 and HC5 values based on species sensitivity distributions which considered toxicity data for invertebrates, fish, amphibians, and plants (Conder et al. 2020). For PFOS, benthic invertebrates such as midges (i.e., aquatic flies such as the non-biting midges, also called chironomids) and damselflies were among the more sensitive species while water fleas, mussels, and snails were less sensitive. For PFOA, water fleas were among the more sensitive species and the midge was the least sensitive species considered.

Recent 20-day toxicity tests with midge (*Chironomus* sp.; McCarthy et al. 2021) confirmed previous work showing that midges, which are tested during their larval phase when they reside within the sediment bed, are one of the most sensitive aquatic organisms when exposed to PFOS (Giesy et al. 2010; Qi et al. 2011; Salice et al. 2018; ECCC 2018). McCarthy et al. (2021) reported that PFOS was three orders of magnitude more toxic than PFHxS, and PFHxS was two orders of magnitude more toxic than PFOA. The 20-day survival no observed effect concentration (NOEC) for PFOS was 0.447 µg/L, which is just below the HC1 of 0.56 µg/L; the survival lowest effect concentration (LOEC) was 2.09 µg/L. The NOEC and LOEC reported for PFOS for the growth test endpoint were higher than for the survival endpoint (2.09 and 4.2 µg/L, respectively), and this observation was also made for the remaining five PFAS tested in this study (NOECs and LOECs for growth endpoint higher than those for the survival endpoint).

Invertebrate toxicity data summarized by Ankley et al. (2021) identified adverse reproductive effects for *Chironomus* sp. occurring between 2 and 10 µg/L for PFOS. Based on the findings from McCarthy et al. (2021) and Ankley et al. (2021), the HC5 of 5.85 µg/L, which is expected to be protective of 95% of freshwater aquatic species, may not be sufficiently protective of all *Chironomus* sp. Given that the 20-day survival NOEC from McCarthy et al. (2021) is approximately equal to the HC1, the HC1 is expected to be protective of sensitive midge species.

As indicated below, the surface water ESVs used in the BERA are below the 20-day survival NOECs for the remaining tested PFAS and therefore these ESVs are expected to be sufficiently protective for midge in the Project 1007 waterways.

Analyte	Surface Water Screening Levels (µg/L)	
	Chronic Surface Water ESVs Used in the BERA	20-Day Survival NOEC (McCarthy et al. , 2021)
PFHpA	870	2,460
PFOA	537	59,400
PFNA	120	1,360
PFBS	3,400	42,700
PFHxS	0.56 (PFOS as a surrogate)	934
PFOS	0.56	0.447

TRVs were preferentially selected from sources (Divine et al. 2020, Zodrow et al. 2020) that followed the USEPA (2005) approach for selecting TRVs which considers multiple studies and typically selects a TRV based on a geometric mean of multiple results. These documents only covered a sub-set of PFAS so some TRVs were selected from Conder et al. (2020) based on single-study sources. TRVs based on geometric means may not be protective of the most sensitive species and TRVs based on single studies provide limited toxicity information for a species that may be sensitive or tolerant of PFAS. Currently there is no consensus on the most appropriate TRVs for use in ERAs, but the selected TRVs provide a reasonable assessment of toxicity based on recent guidance.

In the absence of available PFAS-specific ESVs and TRVs, surrogate values were assigned based on similar chain length and functional groups (Divine et al. 2020 and Zodrow et al. 2020). While the use of surrogate values allows the evaluation of additional PFAS, there are uncertainties associated with whether the selected surrogates are more or less toxic than the PFAS they were selected to represent. In general, if more than one surrogate might be applicable to a particular PFAS, the more conservative (i.e., the more protective) surrogate value was selected. This approach limits the likelihood that risks are underestimated through the use of surrogates.

As indicated in Section 7.1.1, very little PFAS toxicity data is available for reptiles and linkages between PFAS exposures and endpoints relevant to ecological risk assessments are uncertain (ITRC, 2020; Ankley, et al., 2021). While studies have shown the presence of PFOS in blood plasma or eggs (Kannan et al. 2005; Keller, et al., 2005; Wood, et al., 2021), the interpretation of these findings in a risk assessment context is limited without reptile-specific toxicity data for ecologically relevant endpoints. The use of spotted sandpiper HQs for PFOS to assess the potential for adverse effects on the Blanding's turtle assumes that birds and the Blanding's turtle show similar sensitivities to PFOS. Given the lack of reptile toxicity data, this assumption cannot be confirmed, and the Blanding's turtle could be more or less sensitive to PFOS than birds. In a review of reptile and avian toxicity data for lead and several organic pollutants, Weir, et al. (2010) indicated that reptiles were more sensitive than birds for five of the fifteen pollutants. Therefore, birds are not universally more sensitive than reptiles and there is uncertainty associated with the use of the spotted sandpiper to evaluate the Blanding's turtle.

7.3.3 Uncertainties Associated with Food Web Modeling

Site-specific fish, amphibian, and invertebrate data were incorporated into the food web models to provide a realistic exposure scenario for wildlife receptors. The use of site-specific tissues helps to reduce uncertainties in the food web model results since BAFs were only used for a sub-set of tissues (i.e., aquatic invertebrates, aquatic plants, amphibians in Eagle Point Lake and Lake Elmo, and crayfish in Lake Elmo). Aquatic invertebrate tissue generally contributes only a small portion of the TDDs for receptors with HQs above 1 and, as discussed in Section 7.2, may over-estimate concentrations for aerial insects consumed by the little brown bat. The amphibian and crayfish BAFs are based on site-specific data and are expected to be representative of concentrations within the Project 1007 waterways.

As indicated in Section 7.2.1, the use of water-to-plant BAFs, rather than a BSAF for plants, may under-estimate plant tissue concentrations, particular for rooted plants that may serve as the food base for the muskrat and wood duck, although no risk was demonstrated for the wood duck when the water-to-plant BAF or sediment-to-plant BSAF for PFOS is applied (all wood duck HQs < 1). If the BSAF for PFOS was used instead of the water-to-plant BAF, the HQs for the muskrat would be above 1 in both Raleigh Creek-Upper and Eagle Point Lake. In the other areas the muskrat risks are lower and would not be above 1 using the BSAF. The PFOS HQs for the muskrat using the BSAF are indicated below:

- Raleigh Creek-Upper NOAEL- and LOAEL- based HQs of 10 and 5.9, respectively
- Eagle Point Lake NOAEL- and LOAEL- based HQs of 4.7 and 2.8, respectively

The differences in predicted plant concentrations between the BAF and the BSAF represents a source of uncertainty that could be addressed by the collection of plants from within Raleigh Creek-Upper and Eagle Point Lake.

The fish-eating receptors evaluated in the BERA include the great blue heron, bald eagle, mink, and river otter and the size ranges of the fish sampled for tissue analysis should be within the size range of fish consumed by these receptors. All but two forage fish were less than 250 mm which is the upper end of the size range for the great blue heron (USEPA, 1993) and the two larger fish were less than 300 mm. It is expected that the remaining receptors are likely to also consume larger fish. The target range for predator fish in the SAP (AECOM, 2020b) was 200 to 300 mm (approximately 8 to 12 inches) with a sub-set of larger fish to be included if encountered. Larger fish were frequently encountered during the BERA sampling effort and the largest of the fish were filleted for the MPCA to consider for human health evaluations. Thirteen predator fish larger than 300 mm and ranging up to 500 mm were also analyzed and included in the BERA food web models for Eagle Point Lake, Lake Elmo, and the West Lakeland Area. This accounted for approximately half of the predator fish evaluated in the BERA with larger fish collected in all three areas. Given that these fish are on the upper end of the targeted size for inclusion in the BERA, they may contain higher PFAS concentrations than the smaller predator fish that are also included in the diet of the bald eagle, mink, and river otter. This may over-estimate risks if smaller fish are consumed more often. However, it is noted that the forage fish and predator fish concentrations of PFOS showed significant overlap (**Figure 6**) and the EPCs used in the food web models were similar within each waterbody so risks are not expected to be significantly over-estimated by the inclusion of larger predator fish.

One food web assumption that has a direct impact on the calculated HQs is the AUF. This parameter accounts for how much a receptor forages within the exposure area relative to the rest of their home range. As indicated in **Table 4**, AUFs of less than 1 were used for receptors with large home ranges

(i.e., wood duck, tree swallow, bald eagle, river otter) and for some species in the smallest exposure areas (i.e., little brown bat and racoon in Raleigh Creek-Upper and great blue heron, little brown bat, and racoon in Raleigh Creek-Other). An increase in the AUF leads to an increase in the HQs. The home ranges for the receptors were identified in the literature and are documented in Table 2 of each of the food web models presented in **Appendices G through K**. If the AUFs were set to 1 for all receptors, the following additional LOAEL-based HQs above 1 for PFOS would be identified:

- Raleigh Creek-Upper tree swallow (LOAEL-based HQ = 1.3) and little brown bat (LOAEL-based HQ = 2.8)

- Eagle Point Lake river otter (LOAEL-based HQ = 1.1)

These LOAEL-based HQs above 1 are indicative of potential population level impacts, if receptor populations only foraged within the specified areas. However, an AUF of 1 represents the most conservative approach and is likely to overestimate risks in small areas like Raleigh Creek which may be too small to support populations of birds and mammals.

As indicated in Section 7.2.1, the federally-threatened northern long-eared bat has not been documented within the BERA study area (MNDNR, 2021c), but could occasionally forage within portions of the BERA study area and, if the AUF was set to 1 in all areas, the NOAEL-based HQ for PFOS for the little brown bat would be above 1 in Raleigh Creek-Upper (HQ = 4.8). The northern long-eared bat has not been documented within Raleigh Creek-Upper and this exposure area may not represent preferred habitat such that the bats would forage over a smaller than expected home range, so the HQ of 4.8 is expected to be an overestimate of risks to bats. As noted in Section 7.2.1, risks to the little brown bat are based on 1. modeled concentrations of aquatic invertebrates using literature-based BAFs and 2. measured crayfish data to represent benthic invertebrates, which are expected to overestimate risks to bats consuming aerial insects.

7.3.4 Uncertainties Associated with Foam Exposures

As indicated in Section 7.1.2, concentrations of PFOS and other long-chain PFAS in foam exceeded the PFOS HC1 and HC5 chronic aquatic life ESVs and PFOS concentrations also exceeded the acute aquatic life ESV. However, these water-based ESVs may not be applicable to evaluating the exposure of aquatic receptors to foam which is composed of a mixture of air, water, and organic materials. In addition, the chronic ESVs are expected to overestimate risks to aquatic life since foam exposures are typically relatively short-term. Additional study of foam toxicity (e.g., *in situ* toxicity tests) may be useful to further assess the potential for impacts to aquatic life due to short-term exposures to high PFAS concentrations detected in foam.

Wildlife ESVs were not used to evaluate PFAS concentrations in foam as wildlife are not likely to be adversely affected by foam via direct contact (due to the presence of fur, feathers, and scales) and foam is not expected to be a bioaccumulation concern due to the relatively short duration of foam occurrences within a particular area. Receptors like ducks may come in direct contact with foam during swimming and foraging activities; however, it is expected that the presence of feathers limits the potential for dermal contact with PFAS. There is limited dermal absorption of PFAS in water through human skin (USEPA, 2020), so dermal exposures to exposed skin on ducks and other waterfowl are also expected to be limited.

Due to the short-term nature of the foam occurrences, foam is not expected to be a concern to wildlife due to bioaccumulation into plants or prey items. It is likely that wildlife encounter and ingest foam on an occasional basis (incidentally ingested during preening and foraging or during ingestion of water);

however, it is not clear what impacts could occur due to occasional ingestion of foam. It is likely this type of exposure is minimal relative to chronic dietary intake and chronic ingestion of drinking water. To asses this potential chronic ingestion exposure scenario, the wood duck food web model for the West Lakeland Area presented in Table 7 of **Appendix K** was modified such that 10% of the drinking water ingested was assumed to be foam and 90% was surface water (rather than all surface water[5]). This increased the ingested 'surface water' dose from 0.0017 to 18.0 µg/kg_{bw}/day and, as shown in the table below, would result in a NOAEL-based HQ of 0.24 and a LOAEL-based HQ of 0.024.

These results represent a highly unlikely scenario in which ducks ingest the highest PFOS levels detected in foam on a chronic basis, but the findings suggest that population level impacts would not be indicated even under this scenario.

Wood Duck PFOS Potential Daily Dose						NOAEL-based TRV	NOAEL-based HQ	LOAEL-based TRV	LOAEL-based HQ
Benthic Invertebrate	Aquatic Invertebrate	Plant	Sediment	Surface Water	Total				
0.066	0.076	0.92	0.0056	18.0	19.1	79	0.24	790	0.024
Potential Daily Dose and TRVs expressed as micrograms PFOS per kilogram body weight per day (µg/kg_{bw}/day).									

Dennis et al. (2021) reported that chronic drinking water ingestion of PFOS by birds may result in greater toxicity than dietary ingestion. The authors suggest a PFOS chronic LOAEL-based drinking water benchmark of 18.67 µg/L; all the surface water EPCs for PFOS are below this level indicating that the water within the Project 1007 is not expected to pose an ingestion-based risk to bird populations. This threshold was based on a 90-day study and did not identify an acute ingestion toxicity threshold. To assess potential acute ingestion risks to birds due to ingestion of PFOS in foam, uncertainty factors were applied to convert the chronic LOAEL benchmark to an acute median lethal dose (LD50) value. Uncertainty factors from the California Department of Toxic Substances Control's ERA guidance (1996) were used to adjust from the chronic LOAEL to a chronic NOAEL (divided by an uncertainty factor of 5) and from the chronic NOAEL to an acute LD50 (multiplied by an uncertainty factor of 500) to result in an estimated LD50 of 1,867 µg/L.

Five of the 22 foam PFOS concentrations exceed this level; three samples from Raleigh Creek-Upper, one sample from Raleigh Creek-Other, and one sample from the West Lakeland Area. These results suggest that some concentrations of PFOS in foam may pose an acute risk to birds. However, there are uncertainties in this evaluation because the toxicity study was designed to assess longer term ingestion of small doses and the uncertainty factors may not accurately estimate the acute toxicity level. In addition, it is unknown what amount of PFOS birds may be exposed to by occasional ingestion of foam which, *in situ*, is predominantly air (Schilling and Zessner, 2011). To date, bird mortalities within the Project 1007 waterway due to ingestion of foam are not known to have occurred.

In addition to being chemical stressors to birds, PFAS are also possible physical stressors due to their properties as fluorosurfactants, e.g., potential for hypothermia in waterfowl as a result of surfactants stripping the oils out of feathers allowing the skin to get wet (USFWS, 2009). If foam occurs frequently

[5] A drinking water concentration of 2,070 µg/L PFOS was assumed based on 90% surface water (using the surface water EPC of 0.20 µg/L = 0.18 µg/L) and 10% foam (using the maximum foam concentration of 20,700 µg/L = 2,070 µg/L).

in areas where waterfowl gather, it is possible that these types of exposures may occur; however, there is a great deal of uncertainty as to if and how the waterfowl may be physically impacted.

7.3.5 Dissolved and Total Surface Water and Porewater Results

The baseline and seasonal sampling events have not previously analyzed porewater and only analyzed for PFAS in total surface water samples. To support the BERA, dissolved phase porewater data were collected as the dissolved phase PFAS are expected to be the most biologically available fraction for benthic invertebrates present in the sediment. Similarly, dissolved phase surface water data were also collected to see if there were differences in PFAS concentrations in the filtered water (dissolved phase) and in whole water (total).

A review of paired dissolved and total results was conducted to see if the dissolved phase results were consistently lower than the total results and to see how similar or different the results were. Sample-by-sample comparisons of the dissolved phase and total concentrations for surface water are presented in **Appendix A Table 6a** and indicate variability among the two phases where total concentrations are not consistently greater than dissolved concentrations per sample and vice versa. In addition, the concentrations of PFAS in dissolved and total phase samples were typically within 15%. Five PFAS compounds (6:2 fluorotelomer sulfonic acid [6:2 FTS], hexafluoroproylene oxide dimer acid [HFPO-DA], N-EtFOSAA, N-ethyl perfluoroctane sulfonamide [N-EtFOSE], and perfluorotetradecanoic acid [PFTeDA]) had RPDs of total and dissolved concentrations ranging from 72 to 169%. However, these compounds also had lower frequency of detection for both phases than the other PFAS and in some cases (HFPO-DA and PFTeDA) were only detected once in total and dissolved samples. The range of PFOS concentrations detected in dissolved and total phase samples collected in Raleigh Creek, Eagle Point Lake, Lake Elmo, and the West Lakeland Area show substantial overlap (**Figure 12**).

Only three locations were analyzed for PFAS in both dissolved phase and total porewater. Similar to surface water, concentrations of PFAS are variable among the dissolved and total porewater samples and are typically within 15% (**Appendix A Table 6b**).

These results show that in general, the dissolved and total results were similar and that, across all PFAS and samples, when the results were different the total results were not consistently higher or lower than the dissolved phase results. As indicated in **Figure 12**, for PFOS the total results ranged slightly higher than the dissolved in Raleigh Creek-Upper and results in the other areas were nearly the same. Given that the results are not particularly different for PFOS, the only PFAS showing potential risks in the food web model, future sampling of dissolved phase surface water for risk assessment purposes is likely not necessary.

7.3.6 Uncertainties Associated with PFAS Exposures in Nearby Waterbodies

Although the focus of the BERA is on Raleigh Creek, Eagle Point Lake, Lake Elmo, and the West Lakeland Area, samples have been collected from several additional waterbodies in the vicinity of Project 1007 (**Figure 13**). Other waterbodies sampled include Valley Branch/Lake Edith, Sunfish Lake, Goose Lake, Fredrich's Pond, Margaret Lake, Park Pond, St. Croix River, Legion's Pond, Down's Lake, Goose Lake, Farney Creek, and samples collected near the ODS. While many samples were collected from within areas likely to provide habitat for aquatic receptors and wildlife (e.g., Valley Branch, Sunfish Lake, Browns Pond), other samples were collected from culverts and retention ponds that were sampled to help define the nature and extent of PFAS but do not offer viable ecological habitat. However, all samples were included in the evaluation below.

Appendix F provides ESV comparison tables for the surface water, sediment, and foam samples collected from these areas. In surface water, the maximum detected concentration of PFOS from this dataset exceeded the NOAEL-based wildlife ESV, but not the chronic aquatic life ESV. In sediment, the maximum detected concentration of PFOS exceeded the wildlife ESV, but not the benthic aquatic life ESV. In foam, PFOS concentrations in the seven samples collected outside the BERA exposure areas exceeded the HC1 chronic surface water ESV (0.56 µg/L), four of the samples exceeded the HC5 (5.85 µg/L), and none of the foam samples exceeded the acute surface water ESV (570 µg/L).

The HQs above 1 for the individual samples collected from outside the BERA exposure areas are shown below.

HQs > 1 Outside the BERA Exposure Areas		
Surface Water – NOAEL-based Wildlife HQs	**Sediment - NOAEL-based Wildlife HQs**	**Foam - Chronic Aquatic Life HQs**
ODS Culvert and Retention Pond - PFOS HQ = 1.5 (OD1), 4.3 (OD2), 2.7 (OD2) Raleigh Creek Culvert - PFOS HQ = 4.4 (RC3CUL) West Lakeland Area Upstream from Rest Area Pond - PFOS HQ = 1.5 (WL18), 1.5 (WL18), 2.6 (WL18) Downstream from Rest Area Pond - PFOS HQ = 1.9 (WL19), 2.2 (WL20)	Farney Creek - PFOS HQ = 1.7 (FC2A)	Farney Creek - PFOS HQ = 91 (FC2) Sunfish Lake - PFOS HQ = 2.0 (EP25) Goose Lake - PFOS HQ = 3.0 (GL1) Friedrich's Pond - PFOS HQ = 21 (FP1) Valley Branch - PFOS HQ = 4.6 (VB1), 184 (VB3), 174 (VB3)

Of the locations identified above, the ODS samples and the Raleigh Creek culvert sample represent conditions associated with the disposal area. They were collected to better determine potential flow paths of PFAS entering Raleigh Creek from ODS and are essentially accounted for within the Raleigh Creek-Upper datasets evaluated in the BERA. The West Lakeland Area surface water samples collected in the vicinity of the I-94 Rest Area Pond and a Farney Creek sediment sample resulted in wildlife-based HQs slightly above 1. However, as indicated in Section 7.2, the wildlife ESVs over-estimate risks to wildlife when compared to the food web models conducted with measured tissue samples. Therefore, the wildlife HQs above 1 based on the surface water and sediment evaluations are likely to overestimate actual risks. While tissue sampling could be conducted to better assess conditions in Farney Creek and in the vicinity of the I-94 Rest Area Pond, this is a relatively low priority data gap to address due to the low NOAEL-based HQs for the existing samples.

Although concentrations of PFOS in foam in the samples collected from Farney Creek, Sunfish Lake, Goose Lake, Friedrich's Pond, and Valley Branch exceeded the most conservative chronic surface water ESV for PFOS, they did not exceed the acute ESV which is likely more applicable to the intermittent foam exposures for aquatic life.

Several of the listed mollusk and fish species (**Table 1**) were identified within the St. Croix River (MNDNR, 2021c). Surface water concentrations from the St. Croix River were previously evaluated in the SLERA (AECOM, 2020a) and were included in the 'Other Areas' dataset presented in **Appendix A** and screened in in **Appendix F**. All PFAS concentrations in surface water were below the chronic

aquatic life ESVs indicating that, based on the available toxicity information, mollusks and fish in the St. Croix River are not expected to be adversely impacted by PFAS associated with Project 1007.

During the BERA sampling effort, forage fish (yellow perch) and predator fish (northern pike) tissue samples were collected from within Brown's Pond (see **Appendix B** for the sizes of fish collected). The Brown's Pond data are not presented on **Figure 6** but PFOS in forage fish and predator fish in the pond had lower concentrations than fish from the BERA exposure areas. Forage fish from Brown's Pond averaged 9.6 µg/kg of PFOS and predator fish averaged 18.5 µg/kg. These PFOS fish concentrations are nearly two orders of magnitude lower than the forage fish and predator fish EPCs evaluated in the West Lakeland Area food web model, indicating that the Brown's Pond fish would not pose a risk to birds and mammals foraging in the pond.

The distribution of PFAS detected in forage fish and predator fish collected from Brown's Pond was more variable than in fish collected from within the Project 1007 waterways (**Figure 14**). In fish collected from the BERA exposure areas (**Figures 7e and 7f**), PFOS was the dominant PFAS, particularly in predator fish where it accounted for at least 98% of the total PFAS concentrations detected. In Brown's Pond, PFOS still dominated but only accounted for 50 to 70% of the total PFAS body burden in forage fish and 60 to 80% in predator fish.

Sediment sampling was conducted in February 2021 within the Ideal Avenue Wetland Complex as part of the on-going characterization of the Project 1007 area. This wetland area is within the existing Raleigh Creek-Upper exposure area. Although these data are not yet validated and were not collected for BERA purposes, the PFOS data collected from the top 12 inches (the most surficial horizon) were reviewed to assess whether they might influence the BERA findings. The 42 wetland samples reviewed had PFOS concentrations ranging from 12.7 to 520 µg/kg which is within the range of PFOS concentrations within the Raleigh Creek-Upper dataset. The inclusion of the 42 wetland samples with the existing 39 Raleigh Creek-Upper samples (representing the top 6 inches of sediment) would decrease the UCL for the area slightly (154 vs 149 µg/kg). This assessment indicates that the new data would not significantly change the findings of the BERA. These new data are from a deeper horizon than considered in the BERA, and the more surficial sediments within the wetland may contain higher concentrations of PFOS and other PFAS. If the on-going validation and assessment of the Ideal Avenue Wetland Complex sediment data (which includes samples down to 4 feet) indicate that PFOS concentrations are highest at the surface, then additional sampling of the top 6 inches of sediment may be warranted to assess potential ecological risks.

8.0 Summary and Conclusions

This section presents a summary of the BERA findings and provides an interpretation of the magnitude of potential ecological risk and its significance. The results of this evaluation can be used to determine whether or not a decision can be made that ecological exposure pathways have the potential to pose (or do not pose) a risk to ecological receptors within the Project 1007 waterways. If a determination of no risk can be made, no additional ecological risk evaluation is warranted. Conversely, if a determination of no risk cannot be made, then additional ecological risk evaluation may be required to fill data gaps and lessen sources of uncertainty. The ERA may also move into Risk Management following the BERA.

The primary objective of this BERA was to evaluate whether or not populations of ecological receptors are potentially at risk from exposure to PFAS detected in surface water, sediment, and porewater within the Project 1007 waterways. Exposure areas evaluated in the BERA included: Raleigh Creek-Upper, Raleigh Creek-Other, Eagle Point Lake, Lake Elmo, and the West Lakeland Area. Available data included surface water, sediment, porewater and biological tissue for species likely to represent prey items for birds and mammals foraging within the Project 1007 waterways. Samples were collected over multiple sampling events in 2019 and 2020. Risks to lower trophic level aquatic and benthic receptors were evaluated using direct toxicity-based ESVs and risks to birds and mammals were assessed using deterministic food web models that incorporated area-specific tissue data when available.

The conclusions of the BERA are provided below:

- Aquatic plant, fish, amphibian, water column invertebrate, and benthic invertebrate communities
    - The comparisons of surface water, sediment, and porewater data against chronic exposure ESVs identified no significant risks to most benthic and aquatic species present within the Project 1007 waterways due to direct contact with PFAS. The surface water ESVs (used to evaluate surface water and porewater) were designed to be protective of 95% of all aquatic species and the sediment ESV represents a no effect value protective of benthic invertebrates.

    - Comparisons of surface water and porewater data to the most conservative surface water ESV (i.e., the HC1) for PFOS identified exceedances in Raleigh Creek-Upper and Eagle Point Lake. The NHIS (MNDNR, 2021c) did not identify special status aquatic species (e.g., fish, aquatic invertebrates, benthic invertebrates, mollusks) within Raleigh Creek-Upper or Eagle Point Lake; although two listed fish species (the least darter and pugnose shiner) have each been documented in other waterbodies within the study area. Given that these listed species have not been documented in the areas with HC1 exceedances, these species do not currently appear likely to be adversely impacted by PFOS in surface water. Surveys for the least darter and pugnose shiner could be conducted to assess whether these listed species are present in areas where the surface water exceedances of the HC1 for PFOS occur.

    - The comparison of foam data to acute surface water ESVs identified PFOS concentrations above the ESV in Raleigh Creek-Upper, Raleigh Creek-Other, Lake Elmo, and the West Lakeland Area. Chronic surface water ESVs for PFOS are also exceeded in these areas; however, chronic exposures to PFAS in foam are not

expected for aquatic life but could occur if foam persists in the same area. Although there are significant uncertainties associated with the applicability of this screening, the results indicate the potential for impacts to aquatic life, potentially including the least darter and pugnose shiner, when foam is present and as it dissipates.

- The potential for risks to reptiles is evaluated qualitatively due to a lack of receptor-specific ESVs. Given the lack of significant risks to other aquatic receptors due to direct exposure to surface water and sediments, reptiles may not be at risk due to direct exposure to PFAS. The potential for risks due to exposure to foam may exist, but there are significant uncertainties associated with the impact of this potential exposure medium. The use of the spotted sandpiper as a surrogate species for the evaluation of the state threatened Blanding's turtle indicates the potential for adverse impacts where the NOAEL-based HQs for PFOS are above 1 (i.e., Raleigh Creek-Upper); although there are uncertainties associated with the applicability of avian HQs to reptiles and whether the turtles are present. Surveys for the Blanding's turtle could be conducted to assess whether this species is present within Raleigh Creek-Upper since this area appears to have potentially attractive habitat and elevated PFAS concentrations.

- Avian wildlife communities

  - All NOAEL- and LOAEL-based HQs for the wood duck and bald eagle were less than 1 in all of the BERA exposure areas. No further evaluation or remedial action is warranted for these receptors.

  - The NOAEL-based HQ for PFOS for the spotted sandpiper was above 1 in Raleigh Creek-Upper (HQ = 3.6). Similarly, for the tree swallow the NOAEL-based HQs for PFOS were above 1 in Raleigh Creek-Upper (HQ = 1.5) and Eagle Point Lake (HQ = 1.2). For both birds, the LOAEL-based HQs were less than 1, indicating that population-level risks are unlikely. Threatened and endangered invertivorous birds have not been documented within one-mile of this area, so protection at the population level is the most relevant for this area. Therefore, no further evaluation or remedial action is warranted for invertivorous birds.

  - As discussed above, the spotted sandpiper was also considered as a surrogate species for the state threatened Blanding's turtle and that evaluation indicated the potential for adverse impacts in Raleigh Creek-Upper, if the turtles are present.

  - The LOAEL-based HQ above 1 for the great blue heron in Raleigh Creek-Upper indicates the potential for population-level risks due to food web exposures to PFOS for piscivorous birds. The NOAEL-based HQs, but not the LOAEL-based HQs, for PFOS for the great blue heron were above 1 in Eagle Point Lake, Lake Elmo, and West Lakeland Area. Threatened and endangered piscivorous shorebirds have not been documented within one-mile of these areas, so protection at the population level is the most relevant. Therefore, no further evaluation or remedial action is warranted for piscivorous shorebirds in Eagle Point Lake, Lake Elmo, and the West Lakeland Area. Further evaluation or remedial action is warranted based on the potential for population-level risks to the great blue heron in Raleigh Creek-Upper. Risks to the heron are primarily associated with the consumption of forage fish that have bioaccumulated PFOS. The Forster's tern, a state bird of special status, was

observed slightly more than one mile from Raleigh Creek-Upper in 1994. The deeper pools within the wetlands of Raleigh Creek-Upper may provide areas for the tern to forage for small fish and, if the tern is present, the elevated HQs for the great blue heron indicate that the tern could be adversely affected by PFOS in forage fish in Raleigh Creek-Upper.

- Mammalian wildlife communities
  - All NOAEL- and LOAEL-based HQs for the raccoon and the river otter were less than 1 in all of the BERA exposure areas where these receptors were evaluated. No further evaluation or remedial action is warranted for these receptors.

  - The NOAEL-based HQ for PFOS for the little brown bat was above 1 in Raleigh Creek-Upper (HQ = 1.4). However, the LOAEL-based HQ was less than 1, indicating that population-level risks to typical bat species are unlikely and further evaluation or remedial action is not warranted. While it is possible that the federally threatened northern long-eared bat could occasionally forage in Raleigh Creek-Upper, the species has not been documented within one-mile of the Project 1007 waterways (MNDNR, 2021c) and hibernacula and roosting trees are not present nearby. Resident populations of this special status species do not appear to be present and the consideration of individual-level risks using NOAEL-based HQ is not warranted for the northern long-eared bat.

  - The LOAEL-based HQ above 1 for the muskrat in Raleigh Creek-Upper indicates the potential for population-level risks due to food web exposures to PFOS for herbivorous mammals. HQs for the muskrat would be higher if plant tissue concentrations were estimated from sediment rather than surface water and would also result in a LOAEL-based HQ above 1 for the muskrat in Eagle Point Lake. Therefore, there is some uncertainty in the risk estimates for the muskrat that could be refined through the collection of plant tissues in Raleigh Creek-Upper and Eagle Point Lake. Further evaluation or remedial action is warranted based on the potential for population-level risks to the muskrat (based on modeling plant tissue from sediment) in Raleigh Creek-Upper and Eagle Point Lake.

  - The LOAEL-based HQs above 1 for the mink in Eagle Point Lake and Lake Elmo indicate the potential for population-level risks due to food web exposures to PFOS for piscivorous mammals. The NOAEL-based HQ, but not the LOAEL-based HQ, for PFOS for the mink was above 1 in the West Lakeland Area. Threatened and endangered piscivorous mammals have not been documented within one-mile of the Project 1007 waterways, so protection at the population level is the most relevant. Therefore, no further evaluation or remedial action is warranted for piscivorous mammals in the West Lakeland Area. Further evaluation or remedial action is warranted based on the potential for population-level risks to the mink in Eagle Point Lake and Lake Elmo. Risks to the mink are primarily associated with the consumption of forage fish and predator fish that have bioaccumulated PFOS, and site-specific data for those dietary items were applied.

The potential for wildlife to be significantly exposed to PFAS in foam is not expected, but the importance of wildlife exposures via ingestion or direct contact is a source of uncertainty. In particular, the exposure of birds to elevated concentrations of PFAS in foam via incidental ingestion represents a

significant uncertainty. The identification of water ingestion-based acute toxicity data would help to address this data gap.

As indicated by these findings, the greatest potential for risk occurs for piscivorous birds and mammals with relatively small home ranges (i.e., bald eagles and river otters with larger home ranges were not at significant risk). PFOS concentrations in forage fish in Raleigh Creek-Upper and in forage fish and predator fish in Eagle Point Lake and Lake Elmo are elevated enough to pose a population-level risk to piscivorous birds and mammals like the great blue heron and the mink. These fish are exposed directly to PFOS in the water column and potentially in the sediment (during foraging or nesting activities or as eggs and larvae), but likely the greatest exposure for these fish is through their diet. Forage fish will consume plant matter, invertebrates, and small fish and predator fish will ingest primarily other fish as well as invertebrates.

A remedial action may be warranted to reduce surface water and sediment concentrations to levels that would reduce the potential for population-level risks to the great blue heron and mink by reducing PFOS levels available to fish and aquatic organisms.

Risks to piscivorous birds and mammals were evaluated using site-specific fish tissue so additional analytical data would not be necessary to refine the risk estimates. A population survey could be conducted to assess the use of these exposure areas by great blue heron and mink. The food web model assumed that these receptors obtained all of their diets from Raleigh Creek-Upper, Eagle Point Lake, and Lake Elmo. If that is not the case, the HQs and the extent of remedial action warranted could be reduced.

Based on the results of the food web modeling, PFOS accumulating in plant matter may also pose a population-level risk to herbivorous mammals like the muskrat in Raleigh Creek-Upper and Eagle Point Lake. There are more uncertainties associated with this evaluation since plant tissue was not collected during the BERA sampling event and HQs are based on estimated plant tissue concentrations. Collection of plant matter is recommended to refine the risk estimates for the muskrat. However, if a remedial action is anticipated to address risks to piscivorous birds and mammals, the associated PFAS reductions would also be expected to lower risks to herbivores.

There are uncertainties associated with the potential presence of some state listed species within areas with elevated PFOS concentrations. warranted. The Blanding's turtle has not been observed in the vicinity of the Project 1007 waterways since the 1990s (MNDNR, 2021c) but potential habitat occurs within Raleigh Creek-Upper where elevated concentrations of PFOS in prey items could adversely impact the turtle, if present (based on using the spotted sandpiper as a surrogate species to assess risks to the turtle). Similarly, the Forster's tern was observed once in 1994 slightly more than a mile from potential habitat in Raleigh Creek-Upper. Two listed fish species, the least darter and pugnose shiner, have been documented as recently as 2019 in the vicinity of the Project 1007 waterways (MNDNR, 2021c) but it is unknown if these species occur in Raleigh Creek-Upper where the PFOS EPC in surface water exceeds the most conservative surface water ESV (i.e., the HC1). Conducting surveys to assess the potential for these species to be present in Raleigh Creek-Upper could be useful in determining the level of protection warranted in this area.

Tables

Table 1 Summary of Special Status Species that Potentially Occur at Project 1007

Scientific Name	Common Name	MNDNR Natural Heritage Information System Review	MNDNR - State Rank	USFWS - Federal Rank	IPaC Review - Potentially Near Site?
Rare Species Present In the Vicinity of Project 1007 Waterway					
Birds					
Buteo lineatus	Red-shouldered Hawk	Yes	SPC	NL	
Sterna forsteri	Forster's Tern	Yes **	SPC	NL	
Mammals					
Myotis septentrionalis	Northern Long-eared Bat	No	SPC	THR	Yes
Reptiles					
Emydoidea blandingii	Blanding's Turtle	Yes **	THR	NL	
Fishes					
Acipenser fulvescens	Lake Sturgeon	Yes [St. Croix River]	SPC	NL	
Anguilla rostrata	American Eel	Yes ** [St. Croix River]	SPC	NL	
Alosa chrysochloris	Skipjack Herring	Yes ** [St. Croix River]	END	NL	
Cycleptus elongatus	Blue Sucker	Yes ** [St. Croix River]	SPC	NL	
Etheostoma microperca	Least Darter	Yes	SPC	NL	
Necturus maculosus	Mudpuppy	Yes [St. Croix River]	SPC	NL	
Notropis anogenus	Pugnose Shiner	Yes	THR	NL	
Percina evides	Gilt Darter	Yes ** [St. Croix River]	SPC	NL	
Polyodon spathula	Paddlefish	Yes [St. Croix River]	THR	NL	
Insects					
Bombus affinis	Rusty patched bumble bee	Yes	Watchlist	END	Yes
Danaus plexippus	Monarch Butterfly	No	NL	Candidate	Yes
Lycaeides melissa samuelis	Karner Blue Butterfly	No	END	END	Yes
Pelegrina arizonensis	A Jumping Spider	Yes **	SPC	NL	
Mollusks					
Actinonaias ligamentina	Mucket	Yes [St. Croix River]	THR	NL	
Alasmidonta marginata	Elktoe	Yes [St. Croix River]	THR	NL	
Arcidens confragosus	Rock Pocketbook	Yes [St. Croix River]	END	NL	
Cumberlandia monodonta	Spectaclecase	Yes ** [St. Croix River]	END	END	Yes
Cyclonaias tuberculata	Purple Wartyback	Yes [St. Croix River]	END	NL	
Ellipsaria lineolata	Butterfly	Yes [St. Croix River]	THR	NL	
Elliptio crassidens	Elephant-ear	Yes [St. Croix River]	END	NL	
Elliptio dilatatus	Spike	Yes [St. Croix River]	THR	NL	
Epioblasma triquetra	Snuffbox	No	END	END	Yes
Lampsilis higginsii	Higgins Eye	Yes [St. Croix River]	END	END	Yes
Lasmigona costata	Fluted-Shell	Yes [St. Croix River]	THR	NL	
Ligumia recta	Black Sandshell	Yes [St. Croix River]	SPC	NL	
Megalonaias nervosa	Washboard	Yes [St. Croix River]	END	NL	
Pleurobema sintoxia	Round Pigtoe	Yes [St. Croix River]	SPC	NL	
Quadrula fragosa	Winged Mapleleaf	Yes [St. Croix River]	END	END	Yes
Quadrula metanevra	Monkeyface	Yes [St. Croix River]	THR	NL	
Reginaia ebenus	Ebonyshell	Yes [St. Croix River]	END	NL	
Simpsonaias ambigua	Salamander Mussel	Yes [St. Croix River]	END	NL	
Tritogonia verrucosa	Pistolgrip	Yes [St. Croix River]	END	NL	
Plants					
Taenidia integerrima	Yellow Pimpernel	Yes **	SPC	NL	
Trichophorum clintonii	Clinton's Bulrush	Yes	THR	NL	

Table 1 Summary of Special Status Species that Potentially Occur at Project 1007

Other Special Status Species Potentially Near the Project - Migratory Birds Identified by IPaC Review		
Scientific Name	**Common Name**	**Probability of Presence Within Project 1007 Waterways? ***
Ammodramus henslowii	Henslow's Sparrow	Some probability of presence from June to August; breeding season May to August
Ammodramus leconteii	Le Conte's Sparrow	Some probability of presence in October; breeding season June to August; several periods without survey data
Antrostomus vociferus	Eastern Whip-poor-will	Some probability of presence in May; breeding season May to August
Cardellina canadensis	Canada Warbler	Some probability of presence in May; breeding season May to August
Chlidonias niger	Black Tern	Some probability of presence in September; breeding season May to August
Coccyzus erythropthalmus	Black-billed Cuckoo	Some probability of presence from May to June; breeding season May to October
Dolichonyx oryzivorus	Bobolink	Some probability of presence from May, June, and September; breeding season May to August
Euphagus carolinus	Rusty Blackbird	Some probability of presence in March, April, and September; no breeding in the area
Haliaeetus leucocephalus	Bald Eagle	Some probability of presence in all months; breeding season December to August
Hylocichla mustelina	Wood Thrush	Some probability of presence from May to July; breeding season May to August
Melanerpes erythrocephalus	Red-headed Woodpecker	Some probability of presence in January, June, and September; breeding season May to September
Tringa flavipes	Lesser Yellowlegs	Some probability of presence from April to August; no breeding in the area
Vermivora chrysoptera	Golden-winged Warbler	Some probability of presence in May; breeding season May to July

Notes:

END = Endangered
NL = Not Listed
IPaC = Information for Planing and Consultation
SPC = Special Concern
MNDNR = Minnesota Department of Natural Resources
THR = Threatened

The study area for the MNDNR and USFWS reviews extended approximately one-mile from the Project 1007 waterways.

* Information obtained from IPaC Migratory Bird Probability of Presence graphs based on survey activities and species observations.

** Last observation of the species within the area was more than 20 years ago. This may be due to a lack of surveys in the area and does not necessarily indicate that the species is not present if the relevant habitat is still available.

µg/kg - micrograms per kilogram
µg/L - micrograms per liter
-- No Ecological Screening Value
CAS - Chemical Abstracts Service
ESV - Ecological Screening Value
Surr - Surrogate selected when ESV not available. Surrogates selected based on carbon chain length and PFAS classification.

1 - Hazardous Concentration 1% (HC1) (Conder, et al., 2020).
2 - Chronic recommended water quality (RWQ) risk-based screening level (RBSL)(Divine, et al., 2020).
3 - Aquatic risk-based screening level for wildlife. Selected level is the lowest of the values derived by Devine, et al (2020) for the muskrat, little brown bat, river otter, mink, red-winged blackbird, tree swallow, and brown pelican.
4 - No toxic effects level for benthic invertebrates (NPCA, 2008).

Notes:
See individual food web models in Appendices G through K for additional details and study references.

1 - Dry weight food ingestion rate (FIR) is applied to concentrations of PFAS in sediment, generally reported on dry weight basis.
2 - Wet weight FIR is applied to tissue data, reported on fresh or wet weight basis.
3 - Dietary ingestion rates were calculated by multiplying the receptor- and tissue-specific proportion of diet by the receptor-specific FIR_{ww}.
4 - IR_S is calculated by multiplying the receptor-specific P_S by the receptor-specific FIR_{dw}.
5 - IR_W is reported in L/day or kg/day because 1 L of water has weight of 1 kg
6 - AUF values for receptors were calculated by dividing the size of the exposure area by the home range. If the home range is smaller than the exposure area, an AUF of 1 was used. Site Use Factor (SUF) of 1 was selected for all receptors.

dw - dry weight
EPL - Eagle Point Lake
kg - kilogram
L - liters
LE - Lake Elmo
RC - Raleigh Creek
WLA - West Lakeland Area
ww - wet weight

Exposure Areas (Acres):
RC - Upper = 21
RC - Other = 6
EPL = 160
LE = 284
WLA = 116

N-EtFOSE	NC	ND in Amphibian Tissue	NC	ND in Crayfish Tissue

Notes:
See Table 2 for PFAS analyte abbreviations.
See Appendix E for calculation of Project 1007-specific BAFs. BAFs were only calculated for PFAS evaluated in Lake Elmo and Eagle Point Lake where certain tissue types were not collected.
The individual amphibian and crayfish BAFs were calculated based on the available tissue data and surface water data in the areas identified. The selected BAF is the geometric mean of the individual BAFs from the indicated areas.
BAFs were preferentially selected from Eagle Point Lake and the West Lakeland Area due to similarities in water concentrations with Lake Elmo.
BAFs from Raleigh Creek - Upper and Raleigh Creek - Other were used when insufficient individual BAFs were available from Eagle Point Lake and the West Lakeland Area.

BAF - bioaccumulation factor
kg - kilogram
L - liter
NC - not calculated
ND - not detected
ww - wet weight

1 - The geometric mean BAFs for PFBA were calculated based on individual BAFs from Raleigh Creek - Upper and West Lakeland Areas for which surface water concentrations were comparable to Lake Elmo.

Notes:
See Table 2 for PFAS analyte abbreviations.
dw - dry weight
Geomean - Geometric mean. The selected BAF is based on the geometric mean of several individual BAFs.
kg - kilogram
L - liter
Surr - Surrogate selected when ESV not available. Surrogates selected based on carbon chain length and PFAS classification.
ww - wet weight

1 - Converted to ww tissue using 85.5% moisture content (average of algae [84%] and aquatic macrophytes [87%]; Table 4-2 EPA 1993)

2 - Aquatic/Benthic Invert Values are based on filter-feeding benthic invertebrates (oyster, mussel, gastropod, snail, other bivalves) and were selected to represent aquatic invertebrates (including aerial insects) exposed to PFAS in water. Filter-feeding benthic invertebrates are expected to have exposure to contaminants in the water column similar to other aquatic invertebrate species and expected to have lower exposure to sediments.
3 - Converted to ww tissue using 82% moisture content (bivalves (without shell); Table 4-1 EPA 1993)

Notes:
See Table 2 for PFAS analyte abbreviations.
See individual food web models in Appendices G through K for additional details and study references.
TRVs were selected from the following hierarchy due to preference for EcoSSL TRV-derivation approach (USEPA 2005) and that Zodrow et al. (2020) has been peer reviewed:
1 - Divine et al. (2020) and/or Zodrow et al. (2020)
2 - Condor et al. (2020)
µg/kg-day - micrograms per kilogram body weight per day
EcoSSL - Ecological Soil Screening Level
LOAEL - lowest observed adverse effects level
NOAEL - no observed adverse effects level
Surr - Surrogate selected when TRV not available. Surrogates selected based on carbon chain length and PFAS classification.
TRV - toxicity reference value
USEPA - United States Environmental Protection Agency

NFDHA	73,000	[1] Surr - PFBA		175,000	[1] Surr - PFBA	

Notes:
See Table 2 for PFAS analyte abbreviations.
See individual food web models in Appendices G through K for additional details and study references.
TRVs were selected from the following hierarchy due to preference for EcoSSL TRV-derivation approach (USEPA 2005) and that Zodrow et al. (2020) has been peer reviewed:
1 - Divine et al. (2020) and/or Zodrow et al. (2020)
2 - Condor et al. (2020)
µg/kg-day - micrograms per kilogram body weight per day
EcoSSL - Ecological Soil Screening Level
LOAEL - lowest observed adverse effects level
NOAEL - no observed adverse effects level
Surr - Surrogate selected when TRV not available. Surrogates selected based on carbon chain length and PFAS classification.
TRV - toxicity reference value
USEPA - United States Environmental Protection Agency

Notes:

This table summarizes the surafce water screening evaluation presented in Appendix F.

Analyte presented if detected in at least one sample from this area.

Boldface indicates Maximum HQ > 1.

Shading indicates UCL HQ>1

ESV - Ecological Screening Value.

FOD - Frequency of Detection.

HQ - Hazard Quotient (Maximum Concentration or UCL/ESV).

NE - Not Evaluated. Comparison not necessary if Maximum HQ < 1.

UCL - Upper Confidence Limit.

Notes:
This table summarizes the porewater screening evaluation presented in Appendix F.
Analyte presented if detected in at least one sample from this area.
Boldface indicates Maximum HQ > 1.
Shading indicates UCL HQ>1
ESV - Ecological Screening Value.
FOD - Frequency of Detection.
HQ - Hazard Quotient (Maximum Concentration or UCL/ESV).
NE - Not Evaluated. Comparison not necessary if Maximum HQ < 1.
UCL - Upper Confidence Limit.

Notes:
This table summarizes the porewater screening evaluation presented in Appendix F.
Analyte presented if detected in at least one sample from this area.
Boldface indicates Maximum HQ > 1.
Shading indicates UCL HQ>1
1 - An insufficient number of samples was available to calculate UCLs for total data so the maximum concentration was used in the UCL HQ calculation.

ESV - Ecological Screening Value.
FOD - Frequency of Detection.
HQ - Hazard Quotient (Maximum Concentration or UCL/ESV).
NE - Not Evaluated. Comparison not necessary if Maximum HQ < 1.
UCL - Upper Confidence Limit.

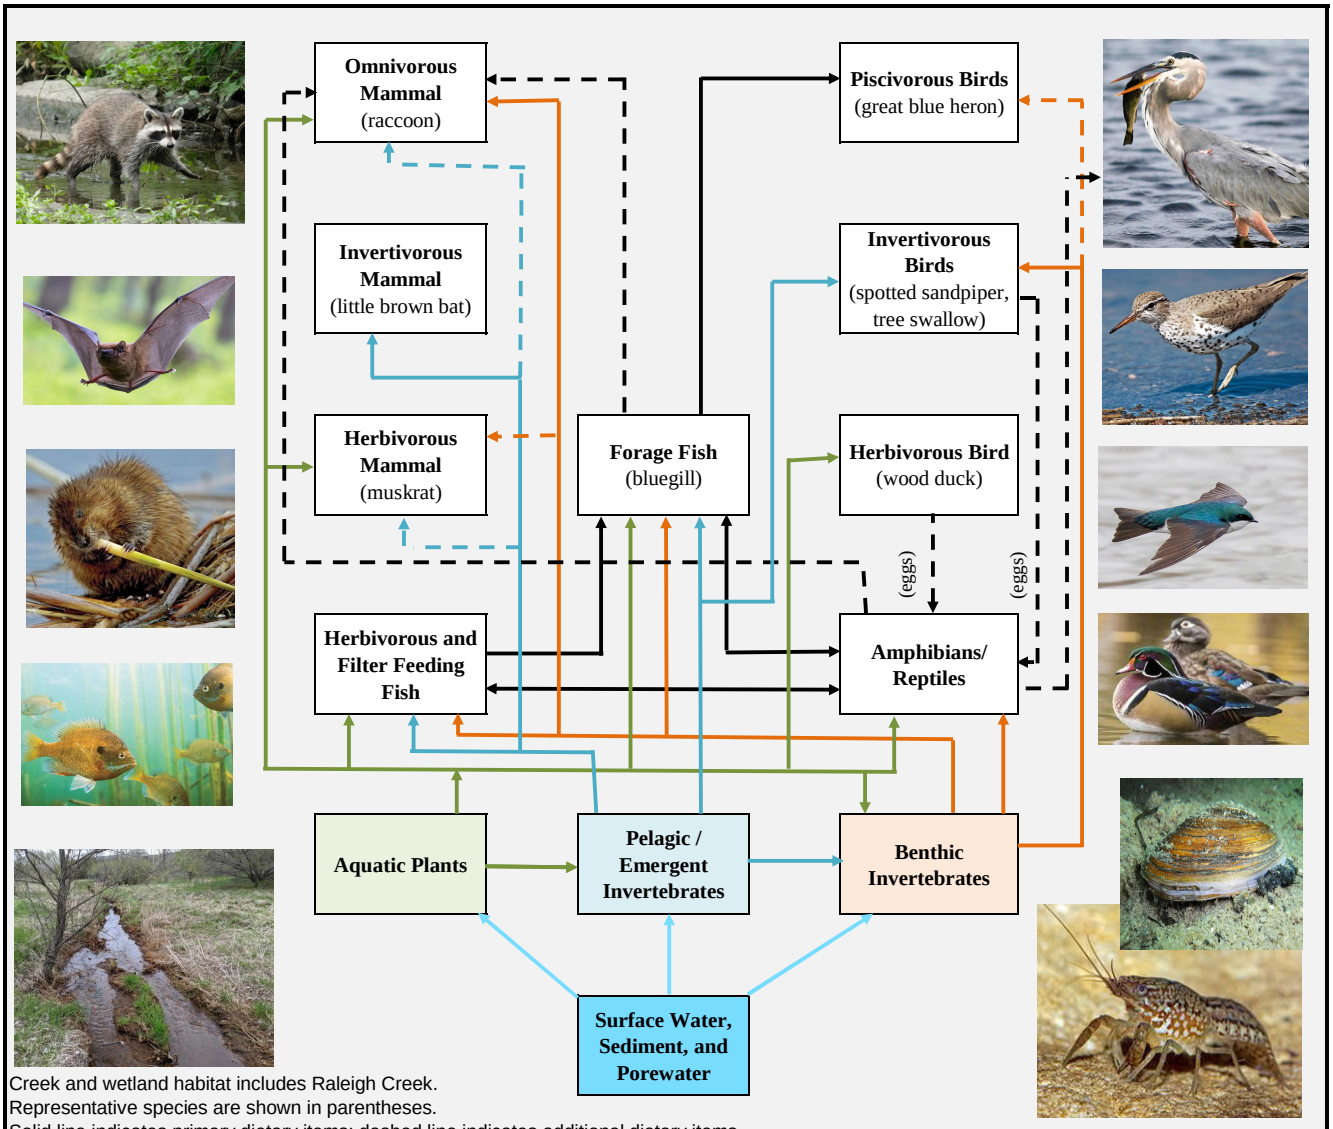
Surface Water – Incidental Ingestion	○	●	●(b)	●(a)	●
Surface Water – Direct Contact	●	●	●(b)	●(a)	○
Surface Water – Bioaccumulation (Diet)	○	●	●(b)	●(a)	●
Foam – Incidental Ingestion	○	●	●(b)	○	○
Foam – Direct Contact	●	●	●(b)	○	○

Notes:
● Potentially complete pathway.
○ Pathway considered to be incomplete, not relevant to the receptor group, or insignificant and not evaluated quantitatively.

(a) The highly soluble nature of PFOS and some other long-chain PFAS results in a high capacity for uptake from the water-column into aquatic tissues as well as into benthic organism tissues at the sediment-surface water interface.
(b) Pathways for reptiles to be evaluated qualitatively due to a lack of receptor-specific screening values.
(c) Fish, particularly bottom-dwelling fish, are also exposed to PFOS in sediment during nesting and foraging; however, sediment screening values for fish are not available so these exposures are considered qualitatively.

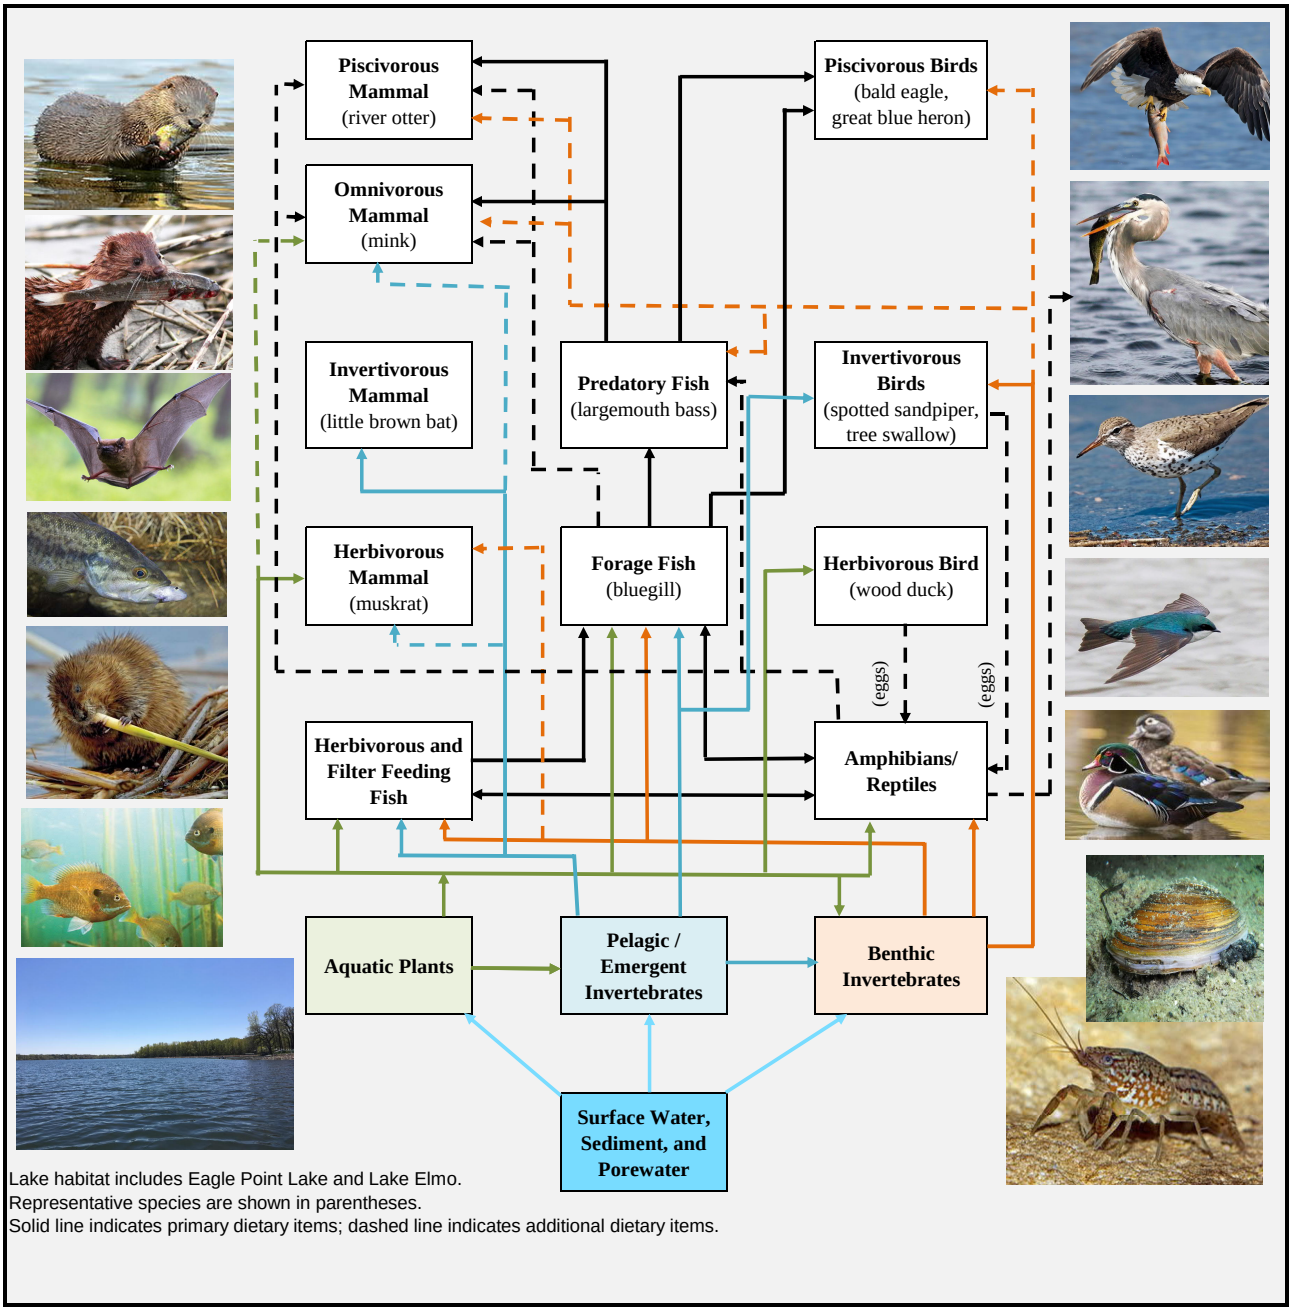
Figure 9

Aquatic Ecological Food Web Model – Creek and Wetland Habitat



Creek and wetland habitat includes Raleigh Creek.
Representative species are shown in parentheses.
Solid line indicates primary dietary items; dashed line indicates additional dietary items.

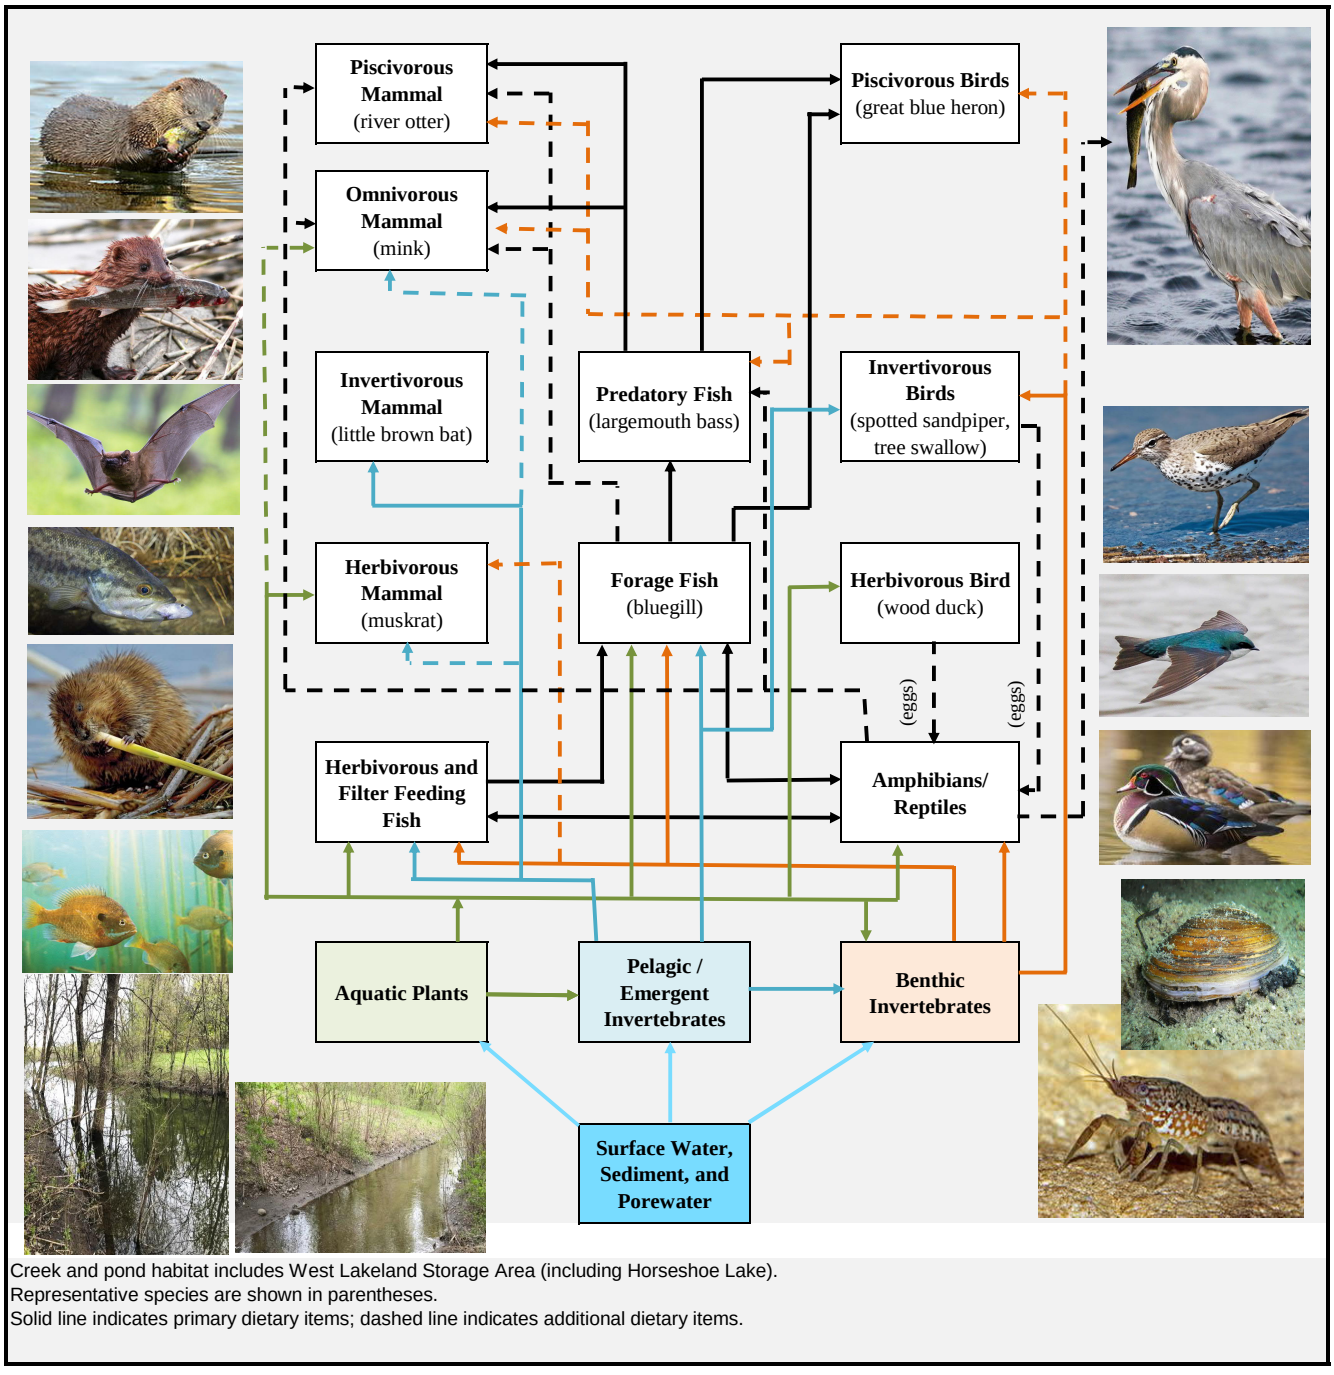
Figure 10
Aquatic Ecological Food Web Model – Lake Habitat



Lake habitat includes Eagle Point Lake and Lake Elmo.
Representative species are shown in parentheses.
Solid line indicates primary dietary items; dashed line indicates additional dietary items.

Figure 11

Aquatic Ecological Food Web Model – Creek and Pond Habitat



Creek and pond habitat includes West Lakeland Storage Area (including Horseshoe Lake).
Representative species are shown in parentheses.
Solid line indicates primary dietary items; dashed line indicates additional dietary items.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram (ug/kg).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram (ug/kg).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram (ug/kg).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram (ug/kg).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
J = Estimated concentration.
QC-FR = Duplicate sample.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram wet weight (ug/kg ww).
Analytical method = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram wet weight (ug/kg ww).
Analytical method = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram (ug/kg).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram (ug/kg).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram (ug/kg).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram wet weight (ug/kg ww).
Analytical method = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram wet weight (ug/kg ww).
Analytical method = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram wet weight (ug/kg ww).
Analytical method = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

Notes
ug/kg - micrograms per kilogram (wet weight)
< - Not detected. Concentration is less than the laboratory reportable limit (RL).
CAS - Chemical Abstracts Service.
NC - Not calculated.
R - Rejected.

Compounds are presented if they were detected at least once in fillet or carcass samples.
Results not detected above RLs are presented as < RL.
Whole body concentrations were not calculated if the compound was not detected in both fillet and carcass samples or if one result was rejected.
If a compound was only detected in the fillet or carcass, the RL was used to represent the non-detect result in the whole body calculation.

[1] - Calculated whole body fish concentration =
(fillet concentration * [fillet weight/total weight]) +
(part concentration * [part weight/total weight])

Results not detected above RLs are presented as < RL.
Whole body concentrations were not calculated if the compound was not detected in both fillet and carcass samples or if one result was rejected.
If a compound was only detected in the fillet or carcass, the RL was used to represent the non-detect result in the whole body calculation.

[1] - Calculated whole body fish concentration =
(fillet concentration * [fillet weight/total weight]) +
(part concentration * [part weight/total weight])

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram (ug/kg).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram wet weight (ug/kg ww).
Analytical method = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram wet weight (ug/kg ww).
Analytical method = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

Notes
ug/kg - micrograms per kilogram (wet weight)
< - Not detected. Concentration is less than the laboratory reportable limit (RL).
CAS - Chemical Abstracts Service.
NC - Not calculated.
R - Rejected.

Compounds are presented if they were detected at least once in fillet or carcass samples.
Results not detected above RLs are presented as < RL.
Whole body concentrations were not calculated if the compound was not detected in both fillet and carcass samples or if one result was rejected.
If a compound was only detected in the fillet or carcass, the RL was used to represent the non-detect result in the whole body calculation.

[1] - Calculated whole body fish concentration =
(fillet concentration * [fillet weight/total weight]) +
(part concentration * [part weight/total weight])

Notes
ug/kg - micrograms per kilogram (wet weight)
< - Not detected. Concentration is less than the laborator
reportable limit (RL).
CAS - Chemical Abstracts Service.
NC - Not calculated.
R - Rejected.

Compounds are presented if they were detected at least once in fillet or carcass samples.
Results not detected above RLs are presented as < RL.
Whole body concentrations were not calculated if the compound was not detected in both fillet and carcass samples or if one result was rejected.
If a compound was only detected in the fillet or carcass, the RL was used to represent the non-detect result in the whole body calculation.

[1] - Calculated whole body fish concentration =
(fillet concentration * [fillet weight/total weight]) +
(part concentration * [part weight/total weight])

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram (ug/kg).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram (ug/kg).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method = ALS_Method PFC/537M

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram wet weight (ug/kg ww).
Analytical method = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram wet weight (ug/kg ww).
Analytical method = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram wet weight (ug/kg ww).
Analytical method = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram wet weight (ug/kg ww).
Analytical method = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram (ug/kg).
Analytical method (BERA event) = ALS_Method PFC/537M
Analytical method (other events) = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per liter (ug/L).
Analytical method = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
J = Estimated concentration.
QC-FR = Duplicate sample.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram wet weight (ug/kg ww).
Analytical method = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

NOTES
All results are reported in micrograms per kilogram wet weight (ug/kg ww).
Analytical method = AXYS_MLA-110.

+ = Result may be biased high.
- = Result may be biased low.
CAS = Chemical Abstracts Service.
B = Analyte was present in a blank.
J = Estimated concentration.
R = Rejected result.
U = Concentration is less than the laboratory reportable limit.
NA = Not Applicable/Not Analyzed.

Notes
ug/kg - micrograms per kilogram (wet weight)
< - Not detected. Concentration is less than the laboratory reportable limit (RL).
CAS - Chemical Abstracts Service.
NC - Not calculated.
R - Rejected.

Compounds are presented if they were detected at least once in fillet or carcass samples.
Results not detected above RLs are presented as < RL.
Whole body concentrations were not calculated if the compound was not detected in both fillet and carcass samples or if one result was rejected.
If a compound was only detected in the fillet or carcass, the RL was used to represent the non-detect result in the whole body calculation.

[1] - Calculated whole body fish concentration =
(fillet concentration * [fillet weight/total weight]) +
(part concentration * [part weight/total weight])

Notes
Only paired samples with detected concentrations for both total and dissolved phase were included in this evaluation.
Shading indicates relative percent difference of >30%.
Relative percent difference calculated as: (a -b) / [(a + b)/2] * 100
where:
a = total phase concentration
b = dissolved phase concentration

ug/L - microgram per liter
+ - Result may be biased high
B - Analyte was present in a blank
J - Estimated concentration
WLA - West Lakeland Area

BERA Sampling Event Documentation

Appendix B-1

P1007 Photographic Log

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
1	7/28/2020

Sample ID and Location:

RC3
Raleigh Creek Exits ODS

Description:

Raleigh Creek exits Oakdale Disposal Site (ODS) through a culvert underneath Hadley Ave into a wetland area. The stream channel is well defined but the area does become flooded during high rain events. Small fish and crayfish were observed in the stream channel.

Photo No.	Date:
2	7/28/2020

Sample ID and Location:

RC3A
Wetland downstream of ODS

Description:

Small snails were collected in this area.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
3	9/18/2020

Sample ID and Location:

RC3A
Wetland downstream of ODS

Description:

Fathead minnows were collected with a dip net in the stream channel.

Photo No.	Date:
4	8/15/2019

Sample ID and Location:

RC4
Wetlands east of I-694

Description:

The wetland area continues after Raleigh Creek passes underneath Interstate 694. In most areas the main channel is defined but it does fan out. Multiple stormwater ponds discharge to Raleigh Creek in this area.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
5	9/18/2020

Sample ID and Location:

RC4
Wetlands east of I-694

Description:

Large tadpoles were collected via crayfish traps.

Photo No.	Date:
6	7/28/20

Sample ID and Location:

RC5
Wetlands upstream of railroad track

Description:

Raleigh Creek passes through another culvert and into a third wetland area that is bounded by a road and railroad tracks. Raleigh Creek has been observed to be flowing year round, including winter, up to the rail road tracks.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
7	9/16/20

Sample ID and Location:

RC5

Description:

Foam is often observed in the wetland areas. It accumulates along the bank edge or on plant material. The color (white to brown) and size of the pile of accumulated foam is variable. This foam was collected during the BERA sampling event.

Photo No.	Date:
8	9/18/20

Sample ID and Location:

RC5

Description:

Frog captured near RC5.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
9	8/12/19

Sample ID and Location:

RC7

Description:

Raleigh Creek then enters a wooded residential area. Birds and fish are observed in this area. Neighborhood stormwater retention ponds discharge into Raleigh Creek. These ponds provide additional ecological habitat. Photo is taken during low flow.

Photo No.	Date:
10	4/29/20

Sample ID and Location:

RC7

Description:

Flow is variable throughout the year but does remain flowing during the summer months. It has been observed to completely freeze during the winter. The stream tends to be more erosional in this area with undercut banks and a rockier stream bottom.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
11	8/12/19

Sample ID and Location:

RC7

Description:

Larger piles of foam are often observed accumulating on stream debris in this area.

Photo No.	Date:
12	9/2/20

Sample ID and Location:

RC7

Description:

Green sunfish collected with a trap near RC7.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
13	5/14/20

Sample ID and Location:

RC22

Description:

Raleigh Creek flows into a pond at the edge of the neighborhood.

Photo No.	Date:
14	9/18/20

Sample ID and Location:

RC23

Description:

The water level in the pond varies greatly depending on rainfall during the summer. The small pond remaining was full of trapped mud minnows, small bullheads, and fathead minnows. Raccoon and bird tracks were observed around the pond. Herons and egrets are often observed feeding from the pond.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
15	5/14/20

Sample ID and Location:

RC23

Description:

A second pond is directly adjacent to the first. This pond is deeper and tends to remain inundated for longer periods. It has more floating and submerged vegetation.

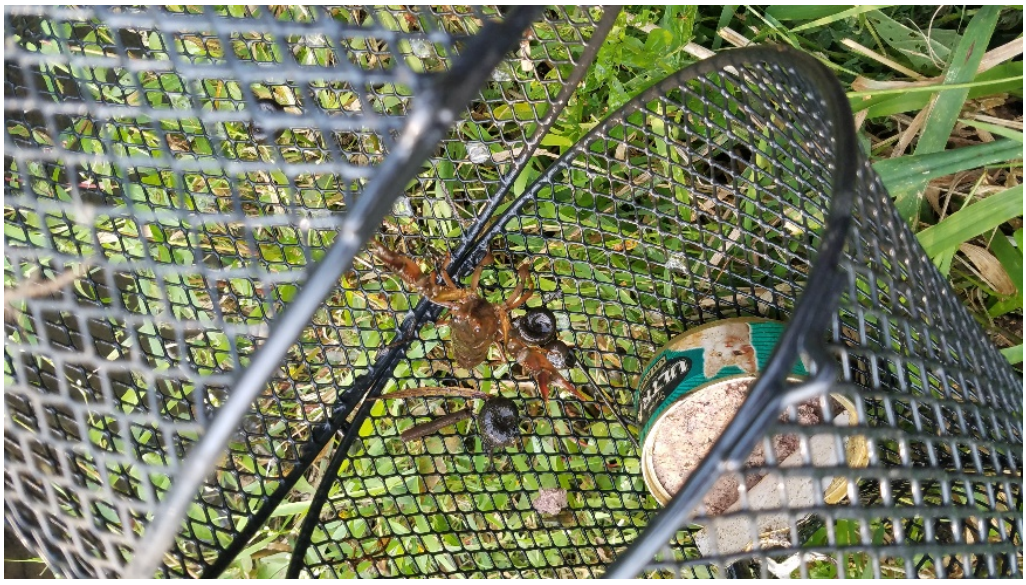
Photo No.	Date:
16	5/14/20

Sample ID and Location:

RC23

Description:

Small snails were found in a trap set in the southern pond.



AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
17	5/14/20

Sample ID and Location:

RC20

Description:

A wetland area extends from the ponds to a storm culvert. This area become flooded after rain events.

Photo No.	Date:
18	5/21/20

Sample ID and Location:

RC20

Description:

There are three main stream channels. Pictured is the largest.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
19	5/14/20

Sample ID and Location:

RC20

Description:

A storm culvert at the end of the wetland area is set 3-4 inches above the wetland area. This and the flow through the wetland controls the water flow downstream of Raleigh Creek.

Photo No.	Date:
20	5/12/20

Sample ID and Location:

RC20

Description:

Downstream of the culverts Raleigh Creek becomes more channelized with a rocky bottom.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
21	5/05/20

Sample ID and Location:

RC12

Description:

Raleigh Creek is often dry except after rain events and in the spring after snow melt downstream of the culverts. The stream bottom is rocky with some depositional areas comprised mostly of sand.

Photo No.	Date:
22	8/12/19

Sample ID and Location:

RC12

Description:

After a rain event, the stream is flowing.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
23	5/7/20

Sample ID and Location:

RC16

Description:

There is a small section of Project 1007 that is not piped after it exits the pipe from the Tri-Lakes Area and upstream of the confluence with Raleigh Creek. The stream is channelized but has wetland vegetation along it.

Photo No.	Date:
24	8/12/19

Sample ID and Location:

RC14

Description:

Project 1007 flowing into the confluence with Raleigh Creek at Tablyn Park.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
25	8/13/20

Sample ID and Location:

RC21

Description:

Downstream of the confluence, foam often forms and accumulates along the stream bank. This segment of Raleigh Creek is flowing continuously except during colder winters when it freezes. The PFAS concentrations vary depending on whether Raleigh Creek is connected.

Photo No.	Date:
26	9/20/20

Sample ID and Location:

RC21

Description:

Multiple crayfish were caught via electroshocking and nets downstream of the confluence. Rocks and undercut banks provide a good habitat for crayfish.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
27	8/14/19

Sample ID and Location:

RC17

Description:

Raleigh Creek then flows through a wooded area and into Lake Elmo Park Reserve. This section of the creek has always been observed to be flowing. Small minnows, crayfish, and frogs have been observed.

Photo No.	Date:
28	9/19/20

Sample ID and Location:

RC18

Description:

As Raleigh Creek enters Lake Elmo Park, the channel widens, and flow rate is reduced. The stream bottom is less rocky and is more depositional.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
29	4/23/20

Sample ID and Location:

RC18

Description:

Large piles of foam have been observed in this area. Fish have been observed swimming beneath the foam.

Photo No.	Date:
30	9/21/20

Sample ID and Location:

RC18A

Description:

A crayfish was caught in a trap in this segment of Raleigh Creek.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
31	9/21/20

Sample ID and Location:

RC18

Description:

A Henry Sampler was used to sample pore water. It was placed at the bottom of the streambank, near where the trap was set and good crayfish habitat, to collect a sample representative of the environment the crayfish is most likely to be exposed to.

Photo No.	Date:
32	9/19/20

Sample ID and Location:

RC18

Description:

Multiple green sunfish and mud minnows were collected with electroshocking and nets along this segment of Raleigh Creek

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
33	4/25/20

Sample ID and Location:

EP17

Description:

The inlet to Eagle Point Lake is a wetland area. Tall vegetation grows along the edges and becomes inundated during high rain periods and after snow melt.

Photo No.	Date:
34	9/24/20

Sample ID and Location:

EP17

Description:

Large snails were observed along the shores of Eagle Point Lake. Multiple were collected for analysis.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
35	7/31/19

Sample ID and Location:

EP3

Description:

Raleigh Creek terminates into Eagle Point Lake. This is the outlet of Eagle Point Lake. Turtles, fish, birds including herons and egrets, and muskrats have been observed.

Photo No.	Date:
36	9/15/20

Sample ID and Location:

EP1A

Description:

Multiple bullheads were caught in the gill nets placed in Eagle Point Lake.

Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
37	9/15/20

Sample ID and Location:

EP18

Description:

Gill nets were used to catch bullheads, bluegills, and large mouth bass on Eagle Point Lake.

Photo No.	Date:
38	9/15/20

Sample ID and Location:

EP26

Description:

Tall grasses and cattails grow along the shoreline of Eagle Point Lake. A crayfish was collected here along the edge of the grasses with a trap.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
39	8/13/19

Sample ID and Location:

EP4

Description:

Eagle Point Lake discharges into a wetland area with a defined channel.

Photo No.	Date:
40	7/31/19

Sample ID and Location:

EP8

Description:

Photo is taken from the top of Eagle Point Dam. Water flows into Eagle Point Dam Lake. From here is it piped under Lake Elmo.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
41	4/27/20

Sample ID and Location:

EP20

Description:

The emergency overflow of the Eagle Point Dam flows into a wetland area. The water here was found to have low dissolved oxygen concentrations and dead fish. The dam does overflow into this area multiple times throughout the year.

Photo No.	Date:
42	4/27/20

Sample ID and Location:

EP20

Description:

Small bluegills and minnows were captured in traps in this area.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
43	5/12/20

Sample ID and Location:

EP15

Description:

Lake Elmo looking to the south from EP15.

Photo No.	Date:
44	5/13/19

Sample ID and Location:

EP14

Description:

Small amount of foam was observed along bank of Lake Elmo near sample location. Foam has also been observed on the west side of the lake depending on the wind direction.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
45	8/13/19

Sample ID and Location:

EP11

Description:

Downstream of Lake Elmo, water from Lake Elmo and Eagle Point Dam are discharged and form a stream that passes through a heavily wooded area. Fish and birds have been observed.

Photo No.	Date:
46	8/13/19

Sample ID and Location:

WL1

Description:

The second golf course pond is lined with rip rap and is immediately adjacent to a mowed fairway.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
47	9/17/2020

Sample ID and Location:

WL2

Description:

Water is piped into Horseshoe Lake. The shoreline of Horseshoe Lake consists of trees and shrubs, a housing development, and a golf course.

Photo No.	Date:
48	9/17/2020

Sample ID and Location:

WL2

Description:

A frog was captured with a dip net along the shore of Horseshoe Lake.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
49	9/17/2020

Sample ID and Location:

WL2

Description:

Collection of the porewater sample at WL2.

Photo No.	Date:
50	9/17/20

Sample ID and Location:

WL5

Description:

Crayfish were caught along the undercut bank in Horseshoe Lake.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
51	9/17/20

Sample ID and Location:

WL6

Description:

Horseshoe Lake discharges via a culvert to a channel that is surrounded by tall grasses and cattails. Smaller largemouth bass and bluegills were caught in the channel between Horseshoe Lake and North Pond.

Photo No.	Date:
52	9/17/20

Sample ID and Location:

WL6

Description:

Foam bubbles are often observed exiting the culvert and occasionally large foam piles are observed such as that collected during the BERA sampling event.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
53	9/17/20

Sample ID and Location:

WL6

Description:

Crayfish remains were observed along the stream channel.

Photo No.	Date:
54	9/17/20

Sample ID and Location:

WL7

Description:

Crayfish were collected via traps and electroshocking along the channel as it flowed from Horseshoe Lake, through farm fields, to the inlet of North Pond.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
55	9/16/20

Sample ID and Location:

WL8 (North Pond)

Description:

Project 1007 flows through three ponds with the first being North Pond.

Photo No.	Date:
56	9/16/20

Sample ID and Location:

WL9

Description:

The ponds are connected by channels. Vegetation around the ponds is primarily trees, shrubs, and tall grasses. Houses border the ponds but rarely have mowed grass at the pond or channel edges. The channel between North and Middle Ponds is shallower and rockier. No fish were observed here but crayfish were harvested.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
57	9/16/20

Sample ID and Location:

WL10

Description:

Multiple crayfish were collected via electroshock and dip nets.

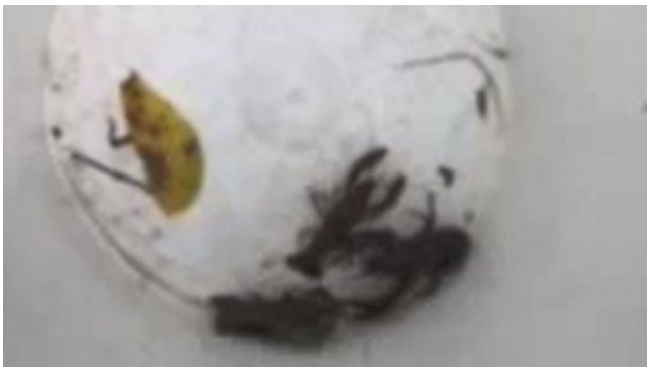

Photo No.	Date:
58	9/16/20

Sample ID and Location:

WL10

Description:

Henry Sampler used to collect pore water samples. The tubing was connected to a peristaltic pump.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
59	9/16/20

Sample ID and Location:

WL21 (Middle Pond)

Description:

Electrofishing was used for sampling on Middle and South Ponds. Fish were observed at the inlet and outlets of the ponds.

Photo No.	Date:
60	9/16/20

Sample ID and Location:

WL21 (Middle Pond)

Description:

Middle Pond has submerged and floating vegetation. The shoreline is surrounded by trees and shrubs.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
61	9/28/20

Sample ID and Location:

WL14

Description:

Deer have been observed around the ponds and channels.

Photo No.	Date:
62	9/16/20

Sample ID and Location:

WL23 (South Pond)

Description:

Electrofishing was used on Middle and South Ponds to collect fish samples.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
63	9/16/20

Sample ID and Location:

WL15 (South Pond)

Description:

South Pond is the largest and deepest of the three ponds. The outlet is to a channel which is then primarily piped to the St. Croix River.

Photo No.	Date:
64	9/16/20

Sample ID and Location:

WL21 (Middle Pond)

Description:

Electrofishing was used for sampling on Middle and South Ponds. Fish were observed at the inlet and outlets of the ponds.

AECOM

PHOTOGRAPHIC LOG

Project Name:	Site Location:	Project No.
Project 1007 BERA | MPCA	Twin Cities East Metro, Minnesota	60638005

Photo No.	Date:
65	9/16/20

Sample ID and Location:

WL15

Description:

Largemouth bass and bluegills were caught on South Pond.

Appendix B-3

Field Forms for BERA Sampling Effort

ECO SURFACE WATER SAMPLE FORM

Location Type:

BANK/SHORE IN WATER BODY WETLANDS

CREEK/CHANNEL CENTER CREEK/CHANNEL BANK

Sampling Type: BULK MID BOT

Sampling Device: DIPPER GRAB PERISTALTIC

*Note if a "stand alone" fall sample, field quality parameters do not need to be collected

Date: 9/19/20

Location ID: RC3A

Sample Depth:

Field Staff: AS/AL/DB

Duplicate or MS/MSD Taken: □ Yes ☒ No

Fall Seasonal Sample □ Yes ☒ No

Corresponding species sample(s) and ID(s)?

RC3A-AMPH-COMP-ONE-01-091920 @1020

+ small tad pools

Are there corresponding sediment and porewater samples? Sample IDs?

There will be ~ 40 feet east of trap

Is this coincident with a fall seasonal sample or a standalone fall seasonal sample?

No

Other details (describe foam here if observed):

SAMPLE POINT CONDITIONS

Surface water estimated depth (inches) at sample point:

Surface water estimated width at sample location (feet):

Sample location relative to channel bottom and distance from bank:

Flow Speed (circle): NO LOW L-M MODERATE M-H HIGH

FIELD WATER QUALITY PARAMETERS

YSI/Hanna SN or other ID:

Temperature (°C): 11.96 pH: 6.97

Temp corr cond (umhos/cm): ~~1,621~~ 2545 Dissolved Oxygen: 3.26 ORP: -128.3

SAMPLES COLLECTED

SAMPLE ID: RC3A-WAT-BULK-01-091920 **Time:** 1045

SAMPLE ID (if multiple water or foam): **Time:**

DUP SAMPLE ID (if applicable): **Time:**

MS/MSD SAMPLE ID (if applicable): **Time:**

Planned Analysis (check if collected)

Sample Naming Convention

LOCID-SAMPLETYPE-DEPTH/DETAILS-01-MMDDYY

Sample Type: WAT

Depth/Secondary Sample Type: BULK (water from creeks/channels or less than 3 feet deep), MID (middle - lakes/ponds), BOT (bottom - lakes/ponds)

Examples: EP3-WAT-MID-01-0922220; EP9A-WAT-BOT-01-092220; RC3-WAT-BULK-01-092220

ECO SEDIMENT SAMPLE FORM

Location of Sample Collection (circle):
CREEK/CHANNEL POND LAKE
BANK WETLAND BEACH OTHER

Date: 9/20/20
Location ID: RC3A
Field Staff: AL/AS

Sampling Device (circle): SHOVEL AUGER GRAB
Sample Depth: 6 INCHES

Porewater Device (if appl): SED POINT PUSH POINT
Duplicate or MS/MSD Taken: ☐ Yes ☒ No

What is the corresponding species sample and ID?
RC3A-CRAY-ONE-092020 0850 RC3A-AMPH-COMP-ONE-0 09192
RC3A-FORE-COMP-ONE-01-092020

Is there a corresponding water sample? Sample ID?
YES RC3A-WATR-BULK-A-091920

Is there a corresponding porewater sample? Sample ID?
YES RC3A-POWAT-01-092020

SAMPLE POINT CONDITIONS

Location within water body and distance from bank (center of creek, bank, bottom of pond/lake):
Center of creek, next to tadpole/minnow collecte ~30 feet down

Surface water estimated depth (in/ft) and width (if applicable): 3 inches

Soil Description (primary, secondary, moist, color, odor, organic content):
30% muck/organic (twig), grass) 10% silt, 55% m→c sand, 15% f pebbles
organic odor
gradient of crayfish typ location

FIELD WATER QUALITY PARAMETERS - BULK WATER

YSI/Hanna SN or other ID:
Temperature (°C): 12.75 pH: 6.72
Temp corr cond (umhos/cm): 2533 Dissolved Oxygen: 4.17 ORP: 78.9

FIELD WATER QUALITY PARAMETERS - PORE WATER (if applicable)

YSI/Hanna SN or other ID:
Temperature (°C): 14.48 pH: 6.17
Temp corr cond (umhos/cm): 1.169 Dissolved Oxygen: 3.38 ORP: -97.9

SAMPLES COLLECTED

Duplicate or MS/MSD Taken: ☐ Yes ☒ No

What is the corresponding species sample and ID?

ask A/H

Is there a corresponding water sample? Sample ID?

yes, RCHA-WAT-BULK-01-091820

Is there a corresponding **porewater** sample? Sample ID?

yes, RCHA-POWAT-01-091820?

SAMPLE POINT CONDITIONS

Location within water body and distance from bank (center of creek, bank, bottom of pond/lake):

center of creek, 50 FT E of RCH culvert,

Surface water estimated depth (in/ft) and width (if applicable): 10 inches

Soil Description (primary, secondary, moist, color, odor, organic content):

Clay, 75 15% f sand, 10% organics, organic odor dark brown to black,

FIELD WATER QUALITY PARAMETERS - BULK WATER

YSI/Hanna SN or other ID:

Temperature (°C): 13.47 pH: 6.60

Temp corr cond (umhos/cm): 2178 Dissolved Oxygen: 2.10 ORP: -67.9

FIELD WATER QUALITY PARAMETERS - PORE WATER (if applicable)

YSI/Hanna SN or other ID:

Temperature (°C): 14.74 pH: 6.75

Temp corr cond (umhos/cm): 1920 Dissolved Oxygen: 0.82 ORP: -148.0

SAMPLES COLLECTED

*Note if a "stand alone" fall sample, field quality parameters do not need to be collected

Fall Seasonal Sample ☐ Yes ☒ No

Corresponding species sample(s) and ID(s)?

Are there corresponding sediment and porewater samples? Sample IDs?

No → ~~no~~ sediment too fine, clogged

Is this coincident with a fall seasonal sample or a standalone fall seasonal sample?

Other details (describe foam here if observed):

located at narrowest point in lake at EP27C

SAMPLE POINT CONDITIONS

Surface water estimated depth (inches) at sample point: 5.5 feet

Surface water estimated width at sample location (feet): 150 feet from west side

Sample location relative to channel bottom and distance from bank:

Flow Speed (circle): (NO) LOW L-M MODERATE M-H HIGH

FIELD WATER QUALITY PARAMETERS

YSI/Hanna SN or other ID:

Temperature (°C): ~~19.35~~ 19.44 pH: 9.04 / 8.48

Temp corr cond (umhos/cm): 413 / 429 Dissolved Oxygen: 12.45 / 12.18 ORP 957 / 927

Examples: EP3-WAT-MID-01-0922220; EP9A-WAT-BOT-01-092220; RC3-WAT-BULK-01-092220

ECO SURFACE WATER SAMPLE FORM

Location Type: Lake / Eco

Date: 9/19/20

BANK/SHORE (IN WATER BODY) WETLANDS

Location ID: EP15

CREEK/CHANNEL CENTER CREEK/CHANNEL BANK

Sample Depth: 3 feet

Sampling Type: BULK (MID) BOT

Field Staff: A Tarara, J. McCoy, H. Orr

Sampling Device: (DIPPER) GRAB PERISTALTIC

Duplicate or MS/MSD Taken: ☐ Yes ☒ No

*Note if a "stand alone" fall sample, field quality parameters do not need to be collected

Fall Seasonal Sample ☒ Yes ☐ No

Corresponding species sample(s) and ID(s)?

EP15 1 small Bass

Are there corresponding sediment and porewater samples? Sample IDs?

Is this coincident with a fall seasonal sample or a standalone fall seasonal sample?

Other details (describe foam here if observed):

Wind 15 mph from south - foam on water from wind

SAMPLE POINT CONDITIONS

Surface water estimated depth (inches) at sample point: 3 feet

Surface water estimated width at sample location (feet): Lake

Sample location relative to channel bottom and distance from bank: 9 feet deep 120 feet from shore

Flow Speed (circle): NO (LOW) L-M MODERATE M-H HIGH

FIELD WATER QUALITY PARAMETERS

YSI/Hanna SN or other ID: Hanna

Temperature (°C): 17.82 pH: 7.84

Temp corr cond (umhos/cm): 344 Dissolved Oxygen: 9.21 ORP: 96.5

MINNESOTA

Minnesota Department of Agriculture 651-201-6148
Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: K2008566 Report date (mm/dd/yyyy): 10/8/2020

Laboratory: ALS - Kelso, Washington Review date (mm/dd/yyyy): 11/22/2020

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	
B.	Is there a sample condition form with the report?		☒	☐	☐	Receipt form indicated a trip blank was received but not listed on the COC (results were not reported for the trip blank in this SDG - see SDG K2008577). COCs listed many water samples that are not reported in this SDG. Receipt form discusses issues with water samples (2 listed on COC were not received, and two additional samples were received that were not listed on COC).
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☐	☒	☐	

G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.	☐	☒	☐	
H.	Are lab IDs cross-referenced correctly with the field IDs.	☒	☐	☐	Yes, but no sample summary table included in the report.

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used during review. See data qualification summary for exceedances and qualifications.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☒	☐	☐	Trip blank reported in K2008577
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☒	☐	The trip blank was nondetect.
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☐	☒	☐	Detects were below the RL: PFOA 0.16 J ng/g
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualification summary for associated samples and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☒	☐	Detects were below the RL. See data qualification summary for calibration blank detects and qualifications.

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☐	☒	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☐	☐	☒	
	ii.	Below the lab QC limits?	☐	☐	☒	

	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☐	☒	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☐	☐	☒	

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☐	☒	☐	MPCA PFAS sed/other limits used: 50% to 150%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☐	☐	☒	
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☐	☒	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	None for this SDG
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	Laboratory duplicate
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	Laboratory duplicate FDs: RC22-SED-0-6-01-091820/RC22-SED-0-6-02-091820

	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*	☒	☐	☐	50% RPD limit for PFAS (sed). RPDs ok

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☐	☒	☐	Results for 11Cl-PF3OUdS, 9Cl-PF3ONS and ADONA were nondetect and reported to the RL, while other PFAS compound were reported to the method detection limit (MDL).

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☒	☐	☐	
C.	Are percent moisture results reported?	☒	☐	☐	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachedment for qualification.

Data Validation Qualifications for K2008566

Calibration (Section 2): Calibration noncompliances and the results qualified are summarized below.

Calibration (Date)	Analyte	%D or %R	Limit	Qualifiers
ICV KC2000521-08 (9/29/20)	EtFOSAA	36.4 %D	±30 %D	Associated results were qualified as estimated (UJ and J): RC7-SED-0-6-01-092120 (K2008566-001) EP19-SED-0-6-01-092020 (K2008566-005) EP27C-SED-0-6-01-091520 (K2008566-006) EP26A-SED-0-6-01-091720 (K2008566-007) RC16A-SED-0-6-01-092120 (K2008566-008) RC18-SED-0-6-01-091720 (K2008566-009) WL5-SED-0-6-01-091720 (K2008566-011) RC7-SED-0-6-01-092020 (K2008566-013)
ICV KC2000533-08 (9/29/20)	11Cl-PF3OUdS	38.22 %D	±30 %D	Associated results were nondetect and qualified as estimated (UJ): All samples were associated with this ICV.
CCV KC2000531 (10/6/2020) 698188	PFOA	151%	70-130%	No results reported from this CCV.

Method blank and instrument blank detections (Section 3Bii and C): Detects within 10 times the blank concentrations were qualified B.

Blank Sample ID	Analyte	Concentration (ng/g)	Results Qualified B
Method Blank KQ2014193-05	PFOA	0.16 J	RC7-SED-0-6-01-092120 (K2008566-001) RC3A-SED-0-6-01-092020 (K2008566-002) RC4A-SED-0-6-01-091820 (K2008566-003) RC5A-SED-0-6-01-091820 (K2008566-004) EP19-SED-0-6-01-092020 (K2008566-005) EP26A-SED-0-6-01-091720 (K2008566-007) RC16A-SED-0-6-01-092120 (K2008566-008) RC18-SED-0-6-01-091720 (K2008566-009) WL5-SED-0-6-01-091720 (K2008566-011) RC7-SED-0-6-01-092020 (K2008566-013) RC22-SED-0-6-01-091820 (K2008566-014)

MINNESOTA

Laboratory data review checklist

Minnesota Department of Agriculture 651-201-6148
Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: K2008577 Report date (mm/dd/yyyy): 10/27/2020

Laboratory: ALS - Kelso, Washington Review date (mm/dd/yyyy): 11/22/2020

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	
B.	Is there a sample condition form with the report?		☒	☐	☐	Receipt form indicated a trip blank was received but not listed on the COC.
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☒	☐	☐	Sample WL5-POWAT-01-091720 (K2008577-006) was re-extracted 21 days over hold time. See data qualification summary for qualifications.
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☐	☒	☐	
H.	Are lab IDs cross-referenced correctly with the field IDs.		☐	☒	☐	No sample summary table included in the report.

					The lab report for the long list of PFAS analytes lists the field ID for sample K2008577-005 as B3-WAT-BULK-02-091620 rather than what is on the COC (B3-WAT-BULK-01-091620).

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used for review. See data qualification summary for exceedances and qualifications.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☒	☐	☐	Trip blank reported
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☒	☐	The trip blank was nondetect.
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☐	☒	☐	Blank detects were below the RL.
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualification summary for summary of detects and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☒	☐	Detects were below the RL. See data qualification summary for calibration blank detects and qualifications.

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	

	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualification summary for summary of qualifications. Two results rejected due to severly low labeled analog recoveries.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS water limits used: 70% to 130%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualification summary for summary of exceedances and qualifications.

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	None for this SDG
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSDs
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSD

	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*	☐	☒	☐	30% limit for PFAS (water). KQ2014877-01/KQ2014877-02: PFHpS 41% RPD The associated result was nondetect. No qualifiers.

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☐	☒	☐	Results for 11Cl-PF3OUdS, 9Cl-PF3ONS and ADONA were nondetect and reported to the RL, while other PFAS compound were reported to the method detection limit (MDL).

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachedment for qualification.

Two results rejected due to severly low labeled analog recoveries.

KQ2016454-02	10/23/20 06:03	PFOS	0.57 J	No associated results.
		PFOA	0.62 J	No associated results.

Labeled Analogs - surrogates (Section 4Bii): Results associated with low recoveries were qualified as estimated (UJ and J+), as these labeled analogs are used to quantitate the analyte of interest and an inverse relationship exists. Two results were rejected (R) due to severely low recoveries.

Sample ID	Lab ID	Labeled Analog	% Recovery (Limits 50% to 200%)	Qualification of Associated non-Labeled Analyte

Data Validation Report

Project:	MCPA – Project 1007
Laboratory:	ALS – Kelso, Washington
Work Order (WO):	K2008578
Analyses/Method:	Polyfluorinated Alkyl Substances (PFASs)/PFAS by HPLC/MS/MS
Validation Level:	Stage 4 for 100% of samples
Prepared by:	Lisa Smith (CEAC) Completed on: 11/20/2020

The samples listed below were collected by AECOM at the Project 1007 Site on September 16 through 20, 2020.

Sample ID	Quality Control	Sample Date	Laboratory ID

TRIP BLANK 1	Trip Blank	9/16/2020	K2008578-013
TRIP BLANK 2	Trip Blank	9/16/2020	K2008578-014

Data validation activities were conducted with reference to:

- Guidance for Perfluorochemicals Analysis, Minnesota Pollution Control Agency (MPCA), July 2020.
- Data Validation Guidelines Module 3: Data Validation Procedure for Per- and Polyfluoroalkyl Substances Analysis by QSM Table B-15, May 1, 2020.

Control limits noted for this review were those from the MPCA Guidance for Perfluorochemicals Analysis, July 2020 and were used to evaluate whether quality control criteria were met.

REVIEW ELEMENTS

The data were evaluated based on the following parameters (where applicable to the method):

✓	Data completeness (chain-of-custody (COC)/sample integrity
✓	Sample Receipt and Holding times
✗	Initial calibration/continuing calibration verification
✗	Laboratory and field blanks
✗	Labeled Analogs (Surrogates)
✓	Internal Standards
✗	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✗	Laboratory control sample (LCS)
✗	Field duplicates
✓	Quantitation and Result Verifications

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

SUMMARY

Based on the results of the validation, the data are valid as reported and may be used for decision making purposes. Data qualifications were required as listed in Table 1. Results reported below the reporting limit (RL) were qualified as estimated (J) by the laboratory; qualifications of these results were accepted by the validator, but are not shown in Table 1.

DETAILED REVIEW

Data Completeness

The analytical data package was verified as complete, with the exception that raw instrument printouts were not provided for the initial calibrations. Summary forms were reviewed.

Sample Receipt and Holding Times

Samples were received at the laboratory intact and within the temperature requirement of <6 °C. Two trip blanks were received; however, were not listed on the chain of custody (COC).

Samples were extracted within the 14-day holding time, and analyzed within 28 days of extraction, with the exception of sample RC5A-POWAT-01-0-6-01-091820-F (K2008578-011). The sample was re-extracted 22 days over hold time. Associated detects (PFDS) were qualified as estimated biased low (J-) and nondetects (EtFOSA, EtFOSAA, MeFOSAA, PFTeDA, and PFTrDA) were qualified UJ.

Calibration

Initial calibrations (ICALs) for the target compounds were performed using linear calibrations. Relative standard deviations (RSDs) were within 20% and correlation coefficients were within the criteria of ≥ 0.99.

Initial and continuing calibration verifications (ICVs and CCVs) were performed at the correct frequency, ICVs were within ±30 % Difference (%D) and CCVs were within the criteria of 70-130% recovery, except as listed in the table below.

Calibration (Date)	Analyte	%D or %R	Limit	Qualifiers
ICV KC2000521-08 (9/29/20)	EtFOSAA	36.4 %D	±30 %D	EtFOSAA results not reported from this ICV.
ICV KC2000533-08 (9/29/20)	11Cl-PF3OUdS	38.22 %D	±30 %D	Associated results were nondetect and qualified as estimated (UJ): RC3-WAT-BULK-01-091620 (K2008578-001) RC3-WAT-BULK-02-091620 (K2008578-002) RC3-WAT-BULK-03-091620 (K2008578-012)
CCV KC2000521 (10/1/2020) 697611	8:2 FTS	138 %R	70-130%	Associated results were nondetect. No qualifiers.
CCV KC2000531 (10/6/20) 698189	PFBS	139 %R	70-130%	Associated detects were qualified as estimated biased high (J+): RC3A-WAT-BULK-01-091920 RC4A-POWAT-01-091820 RC5A-BULK-WAT-01-091820
	PFOA	145 %R	70-130%	
	PFTrDA	136 %R	70-130%	
	PFTeDA	170 %R	70-130%	
	NMeFOSE	267 %R	70-130%	
	NEtFOSE	292 %R	70-130%	
	6:2 FTS	134 %R	70-130%	
CCV KC2000572 (10/23/20) 700485	PFTeDA	142 %R	70-130%	Associated results were nondetect. No qualifiers.
	EtFOSA	143 %R	70-130%	
	NEtFOSE	185 %R	70-130%	
CCV KC2000572 (10/28/20) 701226	NEtFOSE	133 %R	70-130%	Associated results were nondetect. No qualifiers.
CCV KC2000537 (10/7/20 5:53) 698190	11Cl-PF3OUdS	132 %R	70-130%	Associated results were nondetect. No qualifiers.

One ICV and CCV were recalculated for PFOS during the validation. Results reported are verified to be correct.

Laboratory and Field Blanks

Method blanks were analyzed to assess laboratory contamination. Target analytes were not detected in method blanks, with the exception of those listed in the table below. Results within 10 times the blank concentration were qualified B.

Method Blank ID	Prep Date	Compound	Blank Concentration (ng/L)	Qualifiers
KQ2014249-04	9/29/2020 9:47	6:2 FTS	4.3 J	Results qualified B: RC3-WAT-BULK-01-091620 (K2008578-001) RC3-WAT-BULK-02-091620 (K2008578-002) RC3-WAT-BULK-03-091620 (K2008578-012)
		8:2 FTS	0.16 J	Associated results were nondetect.
KQ2014290-03	9/29/2020 15:17	MeFOSA	0.51 J	Results qualified B: C5A-POWAT-01-0-6-01-091820 (K2008578-011)
		PFDoDA	1.4 J	
		PFTeDA	2.6 J	No associated results.
		PFTrDA	3.6 J	
KQ2014429-03	10/1/2020 7:40	MeFOSA	0.75 J	Results qualified B: RC4A-WAT-BULK-01-091820 (K2008578-007)
		PFTeDA	3.7 J	Results qualified B: RC5A-BULK-WAT-01-091820 (K2008578-010) RC4A-POWAT-01-091820 (K2008578-008) RC3A-WAT-BULK-01-091920 (K2008578-004)
		PFBS	0.3 J	Associated results were greater than 10 times the blank value. No qualifiers.
		EtFOSA	0.38 J	Associated results were nondetect.
		N-EtFOSE	0.93 J	
		N-MeFOSE	1.1 J	
KQ2014435-03	10/1/2020 9:03	N-EtFOSAA	1.3 J	RC3A-WAT-BULK-01-091920 (K2008578-003)
		PFHpA	0.96 J	Associated results were greater than 10 times the blank value. No qualifiers.
		N-EtFOSE	0.16 J	Associated results were nondetect.
		PFTrDA	1.4 J	
KQ2014516-03	10/2/2020 7:03	PFBA	0.53 J	Associated results were greater than 10 times the blank value. No qualifiers.
		PFHpA	0.73 J	
		MeFOSA	0.71 J	Associated results were nondetect.
KQ2016108-03	10/22/2020 8:46	N-EtFOSE	0.18 J	Associated results were nondetect.
		MeFOSA	0.62 J	No associated results.
		PFOA	0.99 J	

Continuing calibration blanks (CCBs) were analyzed after the CCVs. CCB detections along with data qualifiers are listed below.

CCB Blank ID	Date/Time	Compound	Blank Concentration (ng/L)	Qualifiers
KQ2014505-02	10/1/20 18:11	EtFOSA	0.60 J	Results qualified B: RC3-WAT-BULK-03-091620 (K2008578-012)
KQ2014704-02	10/2/20 14:32	PFOA	0.36 J	Associated results were greater than 10 times the blank value. No qualifiers.
KQ2014730-02	10/5/20 21:16	MeFOSA	0.77 J	Associated results were nondetect.
		EtFOSA	0.40 J	Associated results were nondetect.
KQ2014843-02	10/6/20 23:36	PFHpA	0.66 J	Associated results were greater than 10 times the blank value. No qualifiers.

CCB Blank ID	Date/Time	Compound	Blank Concentration (ng/L)	Qualifiers
		PFTeDA	3.1 J	Associated detects previous qualified due to method blanks.
		MeFOSA	0.58 J	Associated results were nondetect.
KQ2015031-02	10/8/20 10:29	PFHpA	0.67 J	Associated results were greater than 10 times the blank value. No qualifiers.
		MeFOSA	0.62 J	Associated results were nondetect.
		EtFOSAA	0.92 J	Associated results were greater than 10 times the blank value. No qualifiers.
KQ2016454-02	10/23/20 06:03	PFOS	0.57 J	No associated results.
		PFOA	0.62 J	No associated results.
KQ2016704-02	10/28/20 16:44	PFOA	0.44 J	No associated results.

Two trip blanks were associated with this sample group. The trip blanks were nondetect, with the exception of Trip Blank 2 which had a PFHpA detection of 0.96 J ng/L. PFHpA sample concentrations were greater than 10 times the blank concentration and were acceptable without qualification.

Labeled Analogs

Labeled analogs are spiked into all field samples, field QC samples, and method QC samples and are used during quantitation and to evaluate accuracy. Recoveries (%Rs) were within acceptable MPCA limits of 50% to 200%, with the exception of samples listed below. Results associated with low recoveries were qualified as estimated (UJ and J+), as these labeled analogs are used to quantitate the analyte of interest and an inverse relationship exists. Results qualified are also listed below.

Sample ID	Lab ID	Labeled Analog	% Recovery (Limits 50% to 200%)	Qualification of Associated non-Labeled Analyte
RC3-WAT-BULK-01-091620	K2008578-001	D5-EtFOSAA	45	J+

		D9-EtFOSE	31	UJ

Internal Standards

The recoveries for the internal standard 13C7-PFUnDA were within acceptable MPCA limits of 50% to 150%.

MS/MSD Results

Additional sample volume was provided for an MS/MSD for sample RC3-WAT-BULK-03-091620-U. MS/MSD recoveries and RPDs were within the MPCA control limits, and were acceptable except as noted in the table below.

Compound	MS/MSD % Recovery	Recovery Limits	Qualifiers
RC3-WAT-BULK-03-091620-U:			
6:2 FTS	**-160/-135**	70-130	The detects for this sample (and the associated field duplicates) were qualified as estimated biased low (J-): RC3-WAT-BULK-01-091620-U RC3-WAT-BULK-02-091620-U RC3-WAT-BULK-03-091620-U

LCS Results

LCSs are analyzed to monitor the accuracy of the analytical method independent of matrix effects. Laboratory control sample duplicates (LCSDs) results were provided to assess laboratory precision. The LCS/LCSD %Rs and RPDs were within the MPCA limits except as listed below.

LCS/LCSD IDs (Batch)	Compound	LCS % Recovery	Recovery Limits	Qualifiers
KQ2014249-03 (697611)	8:2 FTS	**132/--**	70-130	Associated results were nondetect. No qualifiers.
	PFDS	**61/--**	70-130	Not associated with results reported.

Field Duplicate Results

Field duplicates are collected to assess the overall precision of field sampling and laboratory analysis. Samples RC3-WAT-BULK-02-091620-U and RC3-WAT-BULK-03-091620-U were collected as duplicates of RC3-WAT-BULK-01-091620-U. RPDs for the field duplicates were within the 30 percent limit for water sample, or were within ± 2 times the RL, with the exception of those indicated in bold in the table below. Results associated with field imprecision were qualified as estimated (J).

Analyte	Parent Sample Result (ng/L)	Field Duplicate Result (ng/L)	Triplicate Result (ng/L)	RPD (%)

Quantitation and Result Verifications

Raw data, including quantitation reports, mass abundance reports (and ion profiles), sample prep logs, and instrument run logs were review and results were accurately identified and quantitated, with no transcription errors. The raw data were reviewed and recalculated for PFOS. No anomalies were observed during the re-calculation and verification of the results. Re-calculations are included in Attachment A.

Multiple sample dilutions were performed due to high analyte concentrations. These results were reviewed, and results quantitated within the instrument calibration range and reported from the lowest dilution were generally selected for use.

Results for 11Cl-PF3OUdS, 9Cl-PF3ONS and ADONA were nondetect and reported to the RL, while other PFAS compound were reported to the method detection limit (MDL).

Quantitations were performed to include branched isomer where applicable. In addition, signal to noise ratios were greater than 10:1 for ions used for quantification.

Qualified Analytical Results

Data qualifications for reportable results are listed in Table 1. Results reported below the RL were qualified as estimated (J) by the laboratory; qualifications of these results were accepted by the Validator; however, are not listed in the table below.

Table 1 - Data Validation Summary of Qualified Data

Sample ID	Lab ID	Analyte	CAS Number	Sample Conc (ng/L)	Validation Qualifier (1)	Reason Code (2)

Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: K2008579 Report date (mm/dd/yyyy): 10/28/2020

Laboratory: ALS - Kelso, Washington Review date (mm/dd/yyyy): 11/25/2020

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	
B.	Is there a sample condition form with the report?		☒	☐	☐	Receipt form indicated a trip blank was received but was not listed on the COC.
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☒	☐	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☒	☐	☐	Three samples were re-extracted 22 days over holding time. See data qualification summary for qualifications.
H.	Are lab IDs cross-referenced correctly with the field IDs.		☒	☐	☐	Yes, but no sample summary table included in the report.

2. Calibration

Question			Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.		☒	☐	☐	MN limits used for review. See data qualification summary for exceedances and qualifications.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☒	☐	☐	Trip blank reported
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☒	☐	The trip blank was nondetect.
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☐	☒	☐	Blank detects were below the RL.
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualification summary for summary of detects and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☒	☐	Detects were below the RL. See data qualification summary for calibration blank detects and qualifications.

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualification summary for summary of qualifications. Three results rejected due to severly low labeled analog recoveries.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS water limits used: 70% to 130%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualification summary for summary of exceedances and qualifications.

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☒	☐	☐	EP9A-WAT-MID-03-091920-U (K2008579-008)
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSDs
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☒	☐	☐	See data qualification summary for summary of exceedances and qualifications.
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☒	☐	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSD; MSD FDs: EP9A-WAT-MID-01-091920/EP9A-WAT-MID-02-091920/EP9A-WAT-MID-03-091920
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*		☐	☒	☐	30% limit for PFAS (water). MSD - RPDs ok LCSD and FD - See data qualification summary for summary of exceedances and qualifications.

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☐	☒	☐	Results for 11Cl-PF3OUdS, 9Cl-PF3ONS and ADONA were nondetect and reported to the RL, while other PFAS compound were reported to the method detection limit (MDL).

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	Numerous issues discussed in case narrative.

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachedment for qualification.

Three results rejected due to severly low labeled analog recoveries.

Certification

By typing my name below, I certify the above statements to be true and correct, to the best of my knowledge, and that this information can be used for the purpose of processing this form.

Minnesota Department of Agriculture 651-201-6148
Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: K2008580 Report date (mm/dd/yyyy): 10/27/2020

Laboratory: ALS - Kelso, Washington Review date (mm/dd/yyyy): 11/27/2020

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	
B.	Is there a sample condition form with the report?		☒	☐	☐	Receipt form indicated a trip blank was received but was not listed on the COC.
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☒	☐	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☒	☐	☐	Trip blank noted as being extracted over hold time. No qualifiers as the trip blank sample date is usually set as that of the earliest sample collected.
H.	Are lab IDs cross-referenced correctly with the field IDs.		☒	☐	☐	Yes, but no sample summary table included in the report.

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used for review. See data qualification summary for exceedances and qualifications.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☒	☐	☐	Trip blank reported
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☒	☐	The trip blank was nondetect.
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☐	☒	☐	Blank detects were below the RL.
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualification summary for summary of detects and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☒	☐	Detects were below the RL. See data qualification summary for calibration blank detects and qualifications.

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualification summary for summary of qualifications. Twenty-one results rejected due to severly low labeled analog recoveries.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS water limits used: 70% to 130%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualification summary for summary of exceedances and qualifications.

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	None for this SDG.
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSDs
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSD
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*		☐	☒	☐	30% limit for PFAS (water). LCSD - See data qualification summary for summary of exceedances and qualifications.

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☐	☒	☐	Results for 11Cl-PF3OUdS, 9Cl-PF3ONS and ADONA were nondetect and reported to the RL, while other PFAS compound were reported to the method detection limit (MDL).

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	Numerous issues discussed in case narrative.

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachedment for qualification.

Twenty-one results rejected due to severly low labeled analog recoveries.

Certification

By typing my name below, I certify the above statements to be true and correct, to the best of my knowledge, and that this information can be used for the purpose of processing this form.

Minnesota Department of Agriculture 651-201-6148
Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: K2008581 Report date (mm/dd/yyyy): 10/29/2020

Laboratory: ALS - Kelso, Washington Review date (mm/dd/yyyy): 11/27/2020

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	
B.	Is there a sample condition form with the report?		☒	☐	☐	Receipt form indicated a trip blank was received but was not listed on the COC.
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☒	☐	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☒	☐	☐	Two samples were re-extracted 22 days over holding time. See data qualification summary for qualifications.
H.	Are lab IDs cross-referenced correctly with the field IDs.		☒	☐	☐	Yes, but no sample summary table included in the report.

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used for review. See data qualification summary for exceedances and qualifications.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☒	☐	☐	Trip blank reported
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☒	☐	The trip blank detects were less than the RL: PFOA 0.46 J ng/L EtFOSA 0.3 J ng/L 6:2 FTS 2.3 J ng/L
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☒	☐	☐	See data qualification summary for discussion.
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☐	☒	☐	Blank detects were below the RL.
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualification summary for summary of detects and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☒	☐	Detects were below the RL. See data qualification summary for calibration blank detects and qualifications.

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	

	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualification summary for summary of qualifications. Two results rejected due to severly low labeled analog recoveries.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS water limits used: 70% to 130%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualification summary for summary of exceedances and qualifications.

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	None for this SDG.
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSDs
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSD FDs: RC17A-WAT-BULK-01-091920/RC17A-WAT-BULK-02-091920
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data		☐	☒	☐	30% limit for PFAS (water). LCSD - See data qualification summary for

		impact. **Other RPDs may be acceptable. Check with regulatory agency.*				summary of exceedances and qualifications. FD RPDs ok

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☐	☒	☐	Results for 11Cl-PF3OUdS, 9Cl-PF3ONS and ADONA were nondetect and reported to the RL, while other PFAS compound were reported to the method detection limit (MDL).

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	Numerous issues discussed in case narrative.

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachedment for qualification.

Two results rejected due to severly low labeled analog recoveries.

Certification

By typing my name below, I certify the above statements to be true and correct, to the best of my knowledge, and that this information can be used for the purpose of processing this form.

Data Validation Qualifications for K2008581

Holding Times (Section 1G): Two samples were re-extracted 22 days over hold time. The results reported from the re-extractions were qualified as estimated (UJ/J-). The samples and analytes qualified are listed below.

Field Sample ID	Lab ID	Compounds
RC18-WAT-BULK-01-091720	K2008581-005	EtFOSA
RC18-WAT-BULK-01-091720	K2008581-005	NEtFOSE
RC18-WAT-BULK-01-091720	K2008581-005	NMeFOSE
RC18-WAT-BULK-01-091720	K2008581-005	PFDS
RC18-WAT-BULK-01-091720	K2008581-005	PFTrDA
RC18-POWAT-01-091720	K2008581-006	EtFOSA
RC18-POWAT-01-091720	K2008581-006	NEtFOSE
RC18-POWAT-01-091720	K2008581-006	NMeFOSE
RC18-POWAT-01-091720	K2008581-006	PFDS
RC18-POWAT-01-091720	K2008581-006	PFTrDA

Calibration (Section 2): Calibration noncompliances and the results qualified are summarized below.

Calibration (Date)	Analyte	%D or %R	Limit	Qualifiers
ICV KC2000533-08 (9/29/20)	11Cl-PF3OUdS	38.22 %D	±30 %D	Associated results were nondetect and qualified as estimated (UJ): EP1A-WAT-MID-01-091520 (K2008581-014) EP1A-WAT-BOT-01-091520 (K2008581-012) TRIP BLANK (K2008581-016)
ICV KC2000521-08 (9/29/20)	EtFOSAA	36.4 %D	±30 %D	Associated results were qualified as estimated (UJ/J): EP1A-WAT-BOT-01-091520 (K2008581-012) EP1A-WAT-MID-01-091520 (K2008581-014) TRIP BLANK (K2008581-016)
CCV KC2000537 10/07/20 05:53 698190	11Cl-PF3OUdS	132 %R	70-130%	Associated results were nondetect and were acceptable without qualification.
CCV KC2000521 10/01/20 18:00	8:2 FTS	138 %R	70-130%	Associated results were nondetect. No qualifiers.
CCV KC2000531 (10/6/20 23:25) 698189	PFBS	139 %R	70-130%	Results not reported from this CCV.

Minnesota Department of Agriculture 651-201-6148
Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: K2008582 Report date (mm/dd/yyyy): 10/30/2020

Laboratory: ALS - Kelso, Washington Review date (mm/dd/yyyy): 11/28/2020

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	
B.	Is there a sample condition form with the report?		☒	☐	☐	Receipt form indicated a trip blank was received but not was listed on the COC.
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☒	☐	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☒	☐	☐	Seven samples were re-extracted 22 days over holding time. See data qualification summary for qualifications.
H.	Are lab IDs cross-referenced correctly with the field IDs.		☒	☐	☐	Yes, but no sample summary table included in the report.

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used for review. See data qualification summary for exceedances and qualifications.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☒	☐	☐	Trip blank reported
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☒	☐	The trip blank detects were less than the RL: PFHpA 0.78 J ng/L PFTeDA 2.3 J ng/L
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☒	☐	☐	See data qualification summary for discussion.
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☐	☒	☐	Blank detects were below the RL.
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualification summary for summary of detects and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☒	☐	Detects were below the RL. See data qualification summary for calibration blank detects and qualifications.

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualification summary for summary of qualifications. Three results rejected due to severly low labeled analog recoveries.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS water limits used: 70% to 130%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualification summary for summary of exceedances and qualifications.

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	None for this SDG.
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSDs
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSD
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*		☒	☐	☐	30% limit for PFAS (water). LCSD - ok

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☐	☒	☐	Results for 11Cl-PF3OUdS, 9Cl-PF3ONS and ADONA were nondetect and reported to the RL, while other PFAS compound were reported to the method detection limit (MDL).

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	Numerous issues discussed in case narrative.

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachedment for qualification.

Three results rejected due to severly low labeled analog recoveries.

Certification

By typing my name below, I certify the above statements to be true and correct, to the best of my knowledge, and that this information can be used for the purpose of processing this form.

Data Validation Qualifications for K2008582

Holding Times (Section 1G): Seven samples samples were re-extracted 22 days over hold time. Nondetect results reported from the re-extractions were qualified UJ and detects were qualified as estimated biased low (J-). The samples and analytes qualified are listed below.

Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: K2008583.01 Report date (mm/dd/yyyy): 11/13/2020

Laboratory: ALS - Kelso, Washington Review date (mm/dd/yyyy): 11/28/2020

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	
B.	Is there a sample condition form with the report?		☒	☐	☐	Receipt form indicated a trip blank was received but was not listed on the COC. Receipt form discusses issues with water samples (2 listed on COC were not received, and two additional samples were received that were not listed on COC).
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☐	☒	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☐	☒	☐	

H.	Are lab IDs cross-referenced correctly with the field IDs.	☒	☐	☐	Yes, but no sample summary table included in the report.

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used for review. See data qualification summary for exceedances and qualifications.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☒	☐	☐	Trip blank reported
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☒	☐	The trip blank detects were less than the RL: PFHpA 1.1 J ng/L
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☒	☐	☐	Associated results were greater than 10 times the blank concentration. No qualifiers.
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☐	☒	☐	Blank detects were below the RL.
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualification summary for summary of detects and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☒	☐	Detects were below the RL. See data qualification summary for calibration blank detects and qualifications.

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	

	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualification summary for summary of qualifications.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS water limits used: 70% to 130%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualification summary for summary of exceedances and qualifications.
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☒	☐	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	None for this SDG.
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSDs
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSD
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact.		☐	☒	☐	30% limit for PFAS (water). LCSD - See data qualification summary for summary of exceedances and qualifications.

		**Other RPDs may be acceptable. Check with regulatory agency.*				

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☐	☒	☐	Results for 11Cl-PF3OUdS, 9Cl-PF3ONS and ADONA were nondetect and reported to the RL, while other PFAS compound were reported to the method detection limit (MDL).

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	Numerous issues discussed in case narrative.

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachedment for qualification.

Certification

Data Validation Qualifications for K2008583.01

Calibration (Section 2): Calibration noncompliances and the results qualified are summarized below.

Calibration (Date)	Analyte	%D or %R	Limit	Qualifiers
CCV KC2000537 10/07/20 05:53 698190	11Cl-PF3OUdS	132 %R	70-130%	Associated results were nondetect and were acceptable without qualification.
CCV KC2000531 (10/6/20 23:25) 698189	PFBS	139 %R	70-130%	Results not reported from this CCV.
	PFOA	145 %R	70-130%	
	PFTrDA	136 %R	70-130%	Associated results were nondetect and were acceptable without qualification.
	NMeFOSE	267 %R	70-130%	
	PFTeDA	170 %R	70-130%	J+: RC6-WAT-BULK-01-091820 (K2008583-002)
	NEtFOSE	292 %R	70-130%	
	6:2 FTS	134 %R	70-130%	

Method blank and instrument blank detections (Section 3Bii and C): Detects within 10 times the blank concentrations were qualified B.

Method Blank ID	Prep Date	Compound	Blank Concentration (ng/L)	Results Qualified B
KQ2014429-03	10/1/20 7:40	EtFOSA	0.38 J	Associated results were nondetect.
		MeFOSA	0.75 J	
		NMeFOSE	1.1 J	
		NEtFOSE	0.93 J	RC6-WAT-BULK-01-091820 (K2008583-002)
		PFTeDA	3.7 J	
		PFBS	0.3 J	No associated results.
KQ2014435-03	10/1/20 9:03	EtFOSAA	1.3 J	RC6A-WAT-BULK-01-092020 (K2008583-003)
		NEtFOSE	0.16 J	RC6-WAT-BULK-01-091820 (K2008583-001)
		PFHpA	0.96 J	Associated results were greater than 10 times the blank concentration. No qualifiers.
		PFBA	0.53 J	
		PFHpA	0.73 J	
		PFTrDA	1.4 J	Associated results were nondetect.
		MeFOSA	0.71 J	

CCB Blank ID	Date/Time	Compound	Blank Concentration (ng/L)	Results Qualified B
KQ2014843-02	10/6/20 23:36	PFHpA	0.66 J	Associated results were greater than 10 times the blank concentration. No qualifiers.
		PFTeDA	3.1 J	RC6-WAT-BULK-01-091820 (K2008583-002)
		MeFOSA	0.58 J	Associated results were nondetect.

CCB Blank ID	Date/Time	Compound	Blank Concentration (ng/L)	Results Qualified B
KQ2015031-02	10/8/20 10:29	PFHpA	0.67 J	RC6A-WAT-BULK-01-092020 (K2008583-004) RC7-WAT-BULK-02-091920 (K2008583-009) RC7-WAT-BULK-01-091920 (K2008583-008) RC7-WAT-BULK-01-091920 (K2008583-007) RC6A-POWAT-01-092120 (K2008583-005) RC6A-POWAT-02-092120 (K2008583-006) RC22-WAT-BULK-01-091920 (K2008583-011)

Project information

Project name: Project 1007

Work order number/Lab report ID: K2008624.01 Report date (mm/dd/yyyy): 11/12/2020

Laboratory: ALS - Kelso, Washington Review date (mm/dd/yyyy): 11/29/2020

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	
B.	Is there a sample condition form with the report?		☒	☐	☐	Receipt form indicates the collection date on the COC did not match the sample labels for one sample. The ID on the COC was used as it matched the date in the sample ID. COCs also include water samples not reported in this SDG.
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☐	☒	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☐	☒	☐	

H.	Are lab IDs cross-referenced correctly with the field IDs.	☒	☐	☐	Yes, but no sample summary table included in the report.

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used during review. See data qualification summary for exceedances and qualifications.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☐	☒	☐	
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☐	☒	
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☐	☒	☐	Blank detects were below the RL.
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualification summary for associated samples and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☒	☐	Detects were below the RL. See data qualification summary for calibration blank detects and qualifications.

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☐	☒	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	

	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualification summary for exceedances and qualifications.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS sed/other limits used: 50% to 150%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	KQ2014340-03: 10:2 FTS 178% KQ2014341-03: PFPeS 159% Associated results were nondetect. No qualifiers.
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☒	☐	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☒	☐	☐	EP4-SED-0-6-03-092420 (K2008624-011) EP27B-SED-0-6-092420 (K2008624-021)
	ii.	If no, is there and explanation in the report as to why?		☐	☐	☒	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☐	☒	☐	
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☒	☐	☐	EP4-SED-0-6-03-092420 (K2008624-011): 10:2 FTS 216%/209% EP27B-SED-0-6-092420 (K2008624-021): PFPeS: 176% (MSD %R ok) Associated results were nondetect. No qualifiers.
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	

		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	MSDs FDs: EP4-SED-0-6-01-092420/EP4-SED-0-6-02-092420/EP4-SED-0-6-03-092420 RC13-SED-0-6-01-092320/RC13-SED-0-6-02-092320
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*		☐	☒	☐	50% RPD limit for PFAS (sed). MS/MSD RPDs ok See data qualification summary for field duplicate exceedances and qualifications.

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☐	☒	☐	Results for 11Cl-PF3OUdS, 9Cl-PF3ONS and ADONA were nondetect and reported to the RL, while other PFAS compound were reported to the method detection limit (MDL).

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☒	☐	☐	
C.	Are percent moisture results reported?	☒	☐	☐	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachedment for qualification.

Certification

By typing my name below, I certify the above statements to be true and correct, to the best of my knowledge, and that this information can be used for the purpose of processing this form.

Minnesota Department of Agriculture 651-201-6148
Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: K2008630 Report date (mm/dd/yyyy): 10/28/2020

Laboratory: ALS - Kelso, Washington Review date (mm/dd/yyyy): 11/29/2020

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	
B.	Is there a sample condition form with the report?		☒	☐	☐	A number of sediment samples are listed on the COCs that were not reported in this SDG. Receipt form discusses filter/unfilter labeling issues for sample WL11-POWAT-01-092220.
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☐	☒	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☐	☒	☐	
H.	Are lab IDs cross-referenced correctly with the field IDs.		☒	☐	☐	Yes, but no sample summary table included in the report.

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used for review. See data qualification summary for exceedances. No qualifiers.

3. Blanks

Question			Yes	No	N/A	Comments
A.		Do any of the analyses contain samples for field or trip blanks?	☐	☒	☐	
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☐	☒	
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.		Do method blanks for any analyses contain target analytes above the reporting limit?	☐	☒	☐	Blank detects were below the RL.
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualification summary for summary of detects. No qualifiers.
C.		Do instrument blanks contain analytes above the reporting limit?	☐	☒	☐	Detects were below the RL. See data qualification summary for calibration blank detects and qualifications.

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.		Are the lab recovery limits for surrogates specified on the report?	☒	☐	☐	MPCA limits used: 50% to 200%
B.		Are the surrogates outside lab QC limits? (These should have a data qualifier.)	☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualification summary for summary of qualifications.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS water limits used: 70% to 130%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualification summary for summary of exceedances and qualifications.
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☒	☐	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	None for this SDG.
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSDs
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSDs FD: WL8A-POWAT-01-092220-F/WL8A-POWAT-02-092220-F/WL8A-POWAT-03-092220-F
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*		☐	☒	☐	30% limit for PFAS (water). LCSD - See data qualification summary for summary of exceedances and qualifications. FD (30%RPD or ±RL): ok

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☐	☒	☐	Results for 11Cl-PF3OUdS, 9Cl-PF3ONS and ADONA were nondetect and reported to the RL, while other PFAS compound were reported to the method detection limit (MDL).

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	Numerous issues discussed in case narrative.

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachedment for qualification.

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: K2008635 Report date (mm/dd/yyyy): 10/27/2020

Laboratory: ALS - Kelso, Washington Review date (mm/dd/yyyy): 11/29/2020

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	
B.	Is there a sample condition form with the report?		☒	☐	☐	A number of sediment samples are listed on the COCs that were not reported in this SDG.
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☐	☒	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☐	☒	☐	
H.	Are lab IDs cross-referenced correctly with the field IDs.		☒	☐	☐	Yes, but no sample summary table included in the report.

2. Calibration

Question			Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.		☐	☒	☐	MN limits used for review.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☐	☒	☐	
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☐	☒	
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☐	☒	☐	Blank detects were below the RL.
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☐	☒	☐	See data qualification summary for summary of detects. No qualifiers.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☒	☐	Detects were below the RL. See data qualification summary for calibration blank detects and qualifications.

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualification summary for summary of qualifications.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS water limits used: 70% to 130%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualification summary for summary of exceedances and qualifications.
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☒	☐	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	None for this SDG.
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSDs
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSDs
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*		☐	☒	☐	30% limit for PFAS (water). LCSD - See data qualification summary for summary of exceedances and qualifications.

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☐	☒	☐	Results for 11Cl-PF3OUdS, 9Cl-PF3ONS and ADONA were nondetect and reported to the RL, while other PFAS compound were reported to the method detection limit (MDL).

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	Numerous issues discussed in case narrative.

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachedment for qualification.

Certification

By typing my name below, I certify the above statements to be true and correct, to the best of my knowledge, and that this information can be used for the purpose of processing this form.

Project information

Project name: Project 1007

Work order number/Lab report ID: K2008636 Report date (mm/dd/yyyy): 10/26/2020

Laboratory: ALS - Kelso, Washington Review date (mm/dd/yyyy): 11/29/2020

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	
B.	Is there a sample condition form with the report?		☒	☐	☐	A number of sediment samples are listed on the COCs that were not reported in this SDG.
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☐	☒	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☐	☒	☐	
H.	Are lab IDs cross-referenced correctly with the field IDs.		☒	☐	☐	Yes, but no sample summary table included in the report.

2. Calibration

Question			Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.		☐	☒	☐	MN limits used for review.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☐	☒	☐	
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☐	☒	
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☐	☒	☐	Blank detects were below the RL.
	i.	If yes, are the same compounds present in the samples?	☐	☒	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☐	☒	☐	See data qualification summary for summary of detects. No qualifiers.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☒	☐	Detects were below the RL. See data qualification summary for summary of detects. No qualifiers.

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualification summary for summary of qualifications.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS water limits used: 70% to 130%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualification summary for summary of exceedances and qualifications.
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☒	☐	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	None for this SDG.
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSDs
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSDs
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*		☐	☒	☐	30% limit for PFAS (water). LCSD - See data qualification summary for summary of exceedances and qualifications.

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☐	☒	☐	Results for 11Cl-PF3OUdS, 9Cl-PF3ONS and ADONA were nondetect and reported to the RL, while other PFAS compound were reported to the method detection limit (MDL).

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	Numerous issues discussed in case narrative.

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachedment for qualification.

Data Validation Qualifications for K2008636

Method blank and instrument blank detections (Section 3Bii and C): Detection in the associated blanks are listed below. Results did not require qualification.

Method Blank ID	Prep Date	Compound	Blank Concentration (ng/L)	Results Qualified B
KQ2014746-03	10/7/2020 7:55	PFBA	0.42 J	Associated results were greater than 10 times the blank concentration. No qualifiers.
		PFHpA	0.63 J	Associated results were nondetect or greater than 10 times the blank concentration. No qualifiers.
KQ2014877-03	10/7/2020 7:56	PFBA	0.53 J	Associated results were greater than 10 times the blank concentration. No qualifiers.

CCB Blank ID	Date/Time	Compound	Blank Concentration (ng/L)	Results Qualified B
KQ2015034-02	10/8/20 21:12	MeFOSA	0.63 J	Associated results were nondetect.
		EtFOSA	0.38 J	
		EtFOSE	0.18 J	
KQ2015208-02	10/9/20 15:39	MeFOSA	0.68 J	Associated results were nondetect.

Labeled Analogs - surrogates (Section 4Bii): Results associated with low recoveries were qualified as estimated (UJ and J+), as these labeled analogs are used to quantitate the analyte of interest and an inverse relationship exists.

Sample ID	Lab ID	Labeled Analog	% Recovery (Limits 50% to 200%)	Qualification of Associated non-Labeled Analyte

Tissue Data - SGS AXYS

MINNESOTA

Minnesota Department of Agriculture 651-201-6148
Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: DPWG74675 Report date (mm/dd/yyyy): 12/22/2020

Laboratory: SGS AXYS Review date (mm/dd/yyyy): 1/11/2021

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	Additional samples (not reported in this SDG) were listed on the COCs.
B.	Is there a sample condition form with the report?		☒	☐	☐	
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☐	☒	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☐	☒	☐	
H.	Are lab IDs cross-referenced correctly with the field IDs.		☒	☐	☐	

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used. ICAL, ICV and CCV reviewed. See data qualifications summary for exceedances. No qualifiers.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☐	☒	☐	
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☐	☒	
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☒	☐	☐	
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualifications summary for blank detections and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☐	☒	

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances and qualifications. Twenty-eight results were rejected (R) due to a severely low labeled analog recovery.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS other limits used: 50% to 150%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances. No qualifiers.
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☒	☐	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSD
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSD
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*		☒	☐	☐	MPCA limit: 50% RPD for tissue (other)

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☒	☐	☐	Laboratory J flags indicating a concentration less than limit of quantification are to be retained during reporting.

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachment for qualification.

Twenty-eight results were rejected (R) due to a severely low labeled analog recovery.

Certification

Minnesota Department of Agriculture 651-201-6148
Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: DPWG74676 Report date (mm/dd/yyyy): 12/4/2020

Laboratory: SGS AXYS Review date (mm/dd/yyyy): 12/10/2020

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	Additional samples (not reported in this SDG) were listed on the COCs.
B.	Is there a sample condition form with the report?		☒	☐	☐	
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☐	☒	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☒	☐	☐	Sample receiving log indicates one sample was not received. Also, the bottle labels did not match the COC for one sample. No qualifiers.
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☐	☒	☐	
H.	Are lab IDs cross-referenced correctly with the field IDs.		☒	☐	☐	

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used. ICAL, ICV and CCV reviewed. See data qualifications summary for exceedances. No qualifiers.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☐	☒	☐	
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☐	☒	
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☒	☐	☐	
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualifications summary for blank detections and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☐	☒	

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances and qualifications. Thirty-three results were rejected (R) due to severely low labeled analog recoveries.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS tissue/other limits used: 50% to 150%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	5:3 FTCA 168%/164% Associated results were nondetect and were acceptable without qualification.
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☒	☐	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSD
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSD
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*		☒	☐	☐	50% limit for PFAS (other/tissue)

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☒	☐	☐	

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachment for qualification.

Thirty-three results were rejected (R) due to severely low labeled analog recoveries.

Certification

By typing my name below, I certify the above statements to be true and correct, to the best of my knowledge, and that this information can be used for the purpose of processing this form.

Data Validation Qualifications for DPWG74676

Calibration (Section 2): Calibration noncompliances are summarized below.

Calibration	Analyte	%R	%R Limits	Qualifiers
CCV 11/14/20 7:19	NFDHA	131	70-130%	Associated results were nondetect. No qualifiers.
CCV 11/14/20 13:11	3:3 FTCA	0%	70-130%	Only PFOS dilutions reported from this CCV. No qualifiers.
	PFHpS	0%	70-130%	
	PFDA	Not Reported	70-130%	
	PFDoA	Not Reported	70-130%	
	PFMPA	Not Reported	70-130%	
CCV 11/14/20 17:18	PFDA	Not Reported	70-130%	Only PFOS dilutions reported from this CCV. No qualifiers.
	PFDoA	Not Reported	70-130%	
	PFMPA	0%	70-130%	
	3:3 FTCA	0.2%	70-130%	

Method blank detections (Section 3Bii): Detects within 10 times the method blank concentrations were qualified B.

Labeled Analogs - surrogates (Section 4Bii): Results associated with low recoveries were qualified as estimated (UJ and J+), and detects associated with high recoveries were qualified as estimated biased low (J-), as these labeled analogs are used to quantitate the analyte of interest and an inverse relationship exists. Thirty-three results were rejected (R) due to severely low labeled analog recoveries.

Minnesota Department of Agriculture 651-201-6148
Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: DPWG74677 Report date (mm/dd/yyyy): 12/2/2020

Laboratory: SGS AXYS Review date (mm/dd/yyyy): 12/21/2020

1. Chain of custody, preservation, and holding times

	Questions	Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?	☒	☐	☐	Additional samples (not reported in this SDG) were listed on the COCs.
B.	Is there a sample condition form with the report?	☒	☐	☐	
C.	Were there samples preserved according to program requirements?	☒	☐	☐	
D.	Were samples received in the correct containers?	☒	☐	☐	
	i. Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii. Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?	☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.	☐	☒	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.	☐	☒	☐	
H.	Are lab IDs cross-referenced correctly with the field IDs.	☒	☐	☐	

2. Calibration

Question			Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.		☒	☐	☐	MN limits used. ICAL, ICV and CCV reviewed. See data qualifications summary for exceedances. No qualifiers.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☐	☒	☐	
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☐	☒	
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☒	☐	☐	
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualifications summary for blank detections and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☐	☒	

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances and qualifications. Forty results were rejected (R) due to severely low labeled analog recoveries.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS tissue/other limits used: 50% to 150%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	N-MeFOSE 203%/155% 11Cl-PF3OUdS --/131% 5:3 FTCA --/164% Associated results were nondetect and were acceptable without qualification.
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☒	☐	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSD
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSD
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check*		☒	☐	☐	50% limit for PFAS (other/tissue)

		with regulatory agency.				

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☒	☐	☐	

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachment for qualification.

Forty results were rejected (R) due to severely low labeled analog recoveries.

Certification

By typing my name below, I certify the above statements to be true and correct, to the best of my knowledge, and that this information can be used for the purpose of processing this form.

Data Validation Qualifications for DPWG74677

Calibration (Section 2): Calibration noncompliances are summarized below.

Calibration	Analyte	%R	%R Limits	Qualifiers
CCV 11/23/20 15:58	3:3 FTCA	58.4	70-130%	Only PFOS dilutions reported from this CCV. No qualifiers.
	PFDoA	Not Reported	70-130%	
	PFMPA	Not Reported	70-130%	
CCV 11/23/20 15:58	3:3 FTCA	0.1	70-130%	Only PFOS dilutions reported from this CCV. No qualifiers.
	PFDoA	Not Reported	70-130%	
	PFMPA	Not Reported	70-130%	

Method blank detections (Section 3Bii): Detects within 10 times the method blank concentrations were qualified B.

Blank Sample ID	Analyte	Concentration (ng/g)	Results Qualified B

Labeled Analogs - surrogates (Section 4Bii): Results associated with low recoveries were qualified as estimated (UJ and J+), and detects associated with high recoveries were qualified as estimated biased low

(J-), as these labeled analogs are used to quantitate the analyte of interest and an inverse relationship exists. Forty results were rejected (R) due to severely low labeled analog recoveries.

Sample ID	Lab ID	Labeled Analog	% Recovery (limits 50% to 200%)	Qualification of Associated non-Labeled Analyte

Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: DPWG74689 Report date (mm/dd/yyyy): 12/16/2020

Laboratory: SGS AXYS Review date (mm/dd/yyyy): 1/18/2021

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	Additional samples (not reported in this SDG) were listed on the COCs.
B.	Is there a sample condition form with the report?		☒	☐	☐	
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☐	☒	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☐	☒	☐	
H.	Are lab IDs cross-referenced correctly with the field IDs.		☒	☐	☐	

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used. ICAL, ICV and CCV reviewed. See data qualifications summary for exceedances. No qualifiers.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☐	☒	☐	
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☐	☒	
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☒	☐	☐	
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualifications summary for blank detections and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☐	☒	

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances and qualifications. Forty-five results were rejected (R) due to a severely low labeled analog recovery.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS other limits used: 50% to 150%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances and qualifications.
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☒	☐	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSD
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSD
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*		☒	☐	☐	MPCA limit: 50% RPD for tissue (other) LCSD: RPDs within limits.

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☒	☐	☐	Laboratory J flags indicating a concentration less than limit of quantification are to be retained during reporting.

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachment for qualifications.

Forty-five results were rejected (R) due to a severely low labeled analog recovery.

Certification

By typing my name below, I certify the above statements to be true and correct, to the best of my knowledge, and that this information can be used for the purpose of processing this form.

(This document has been electronically signed.) Date (mm/dd/yyyy): 1/18/2021

Data Validation Qualifications for DPWG74689

Calibration (Section 2): Calibration noncompliances are summarized below.

Calibration Date	Analyte	%R	%R Limit	Qualifiers
24-Nov-2020 11:18	NFDHA	164	70-130	Only PFOS reported from 11/24/20. No qualifiers.

Method blank detections (Section 3Bii): Detects within 10 times the method blank concentrations were qualified B.

Blank Sample ID	Analyte	Concentration (ng/g)	Results Qualified B
WG74153-101	PFUnA	0.161 J	BP1-FORE-FIL-ONE-01-092020 (L33784-12) BP1-FORE-PART-ONE-01-092020 (L33784-13) BP1-FORE-FIL-TWO-01-092020 (L33784-14) BP1-FORE-PART-TWO-01-092020 (L33784-15) RC21A-FORE-WHO-01-092120 (L33784-17) RC18A-FORE-WHO-01-092120 (L33784-18) WL7-FORE-WHO-01-091720 (L33784-19) EP18-FORE-FIL-ONE-01-091520 (L33784-21) EP15-FORE-WHO-THREE-01-091820 (L33784-23) EP27C-FORE-FIL-ONE-01-091520 (L33784-24) EP1A-FORE-FIL-01-091520 (L33784-27) EP1A-FORE-WHO-01-091520 (L33784-29) EP9A-FORE-FIL-ONE-01-091820 (L33784-30) EP9A-FORE-PART-ONE-01-091820 (L33784-31)

	PFOS	0.121 J	Sample concentrations were greater than ten times the blank concentration. No qualifiers.
	PFOSA	0.115 J	BP1-FORE-WHO-THREE-01-091920 (L33784-16) RC21A-FORE-WHO-01-092120 (L33784-17) WL7-FORE-WHO-01-091720 (L33784-19) EP15-FORE-WHO-THREE-01-091820 (L33784-23) EP9A-FORE-PART-ONE-01-091820 (L33784-31)

Labeled Analogs - surrogates (Section 4Bii): Results associated with low recoveries were qualified as estimated (UJ and J+), and detects associated with high recoveries were qualified as estimated biased low (J-), as these labeled analogs are used to quantitate the analyte of interest and an inverse relationship exists. Forty-five results were rejected (R) due to severely low labeled analog recoveries.

Sample ID	Lab ID	Labeled Analog	% Recovery (limits 50% to 200%)	Qualification of Associated non-Labeled Analyte

Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: DPWG74690 Report date (mm/dd/yyyy): 12/2/2020

Laboratory: SGS AXYS Review date (mm/dd/yyyy): 12/13/2020

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	Additional samples (not reported in this SDG) were listed on the COCs.
B.	Is there a sample condition form with the report?		☒	☐	☐	
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☐	☒	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☒	☐	☐	Bottle labels did not match the COC for one sample for those reported in this SDG. The sample was logged in using the ID on the COC.
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☐	☒	☐	
H.	Are lab IDs cross-referenced correctly with the field IDs.		☒	☐	☐	

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used. ICAL, ICV and CCV reviewed. See data qualifications summary for exceedances. No qualifiers.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☐	☒	☐	
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☐	☒	
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☒	☐	☐	
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualifications summary for blank detections and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☐	☒	

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances and qualifications. Forty results were rejected (R) due to severely low labeled analog recoveries.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS tissue/other limits used: 50% to 150%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	N-MeFOSE 196%/181% 5:3 FTCA 157%/177% Associated results were nondetect and were acceptable without qualification.
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☒	☐	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSD
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSD
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check*		☒	☐	☐	50% limit for PFAS (other/tissue)

		with regulatory agency.				

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☒	☐	☐	

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachment for qualification.

Forty results were rejected (R) due to severely low labeled analog recoveries.

Certification

By typing my name below, I certify the above statements to be true and correct, to the best of my knowledge, and that this information can be used for the purpose of processing this form.

Data Validation Qualifications for DPWG74690

Calibration (Section 2): Calibration noncompliances are summarized below.

Calibration	Analyte	%R	%R Limits	Qualifiers
CCV 11/25/20 4:40	3:3 FTCA	0%	70-130%	Only PFOS dilutions reported from this CCV. No qualifiers.
CCV 11/25/20 8:34	3:3 FTCA	0.3%	70-130%	Only PFOS dilutions reported from this CCV. No qualifiers.
	PFMPA	0%	70-130%	
	NFDHA	149%	70-130%	

Method blank detections (Section 3Bii): Detects within 10 times the method blank concentrations were qualified B.

Blank Sample ID	Analyte	Concentration (ng/g)	Results Qualified B

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: DPWG74712 Report date (mm/dd/yyyy): 12/7/2020

Laboratory: SGS AXYS Review date (mm/dd/yyyy): 12/13/2020

1. Chain of custody, preservation, and holding times

	Questions	Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?	☒	☐	☐	Additional samples (not reported in this SDG) were listed on the COCs. A trip blank was received, but was not listed on the COC.
B.	Is there a sample condition form with the report?	☒	☐	☐	
C.	Were there samples preserved according to program requirements?	☒	☐	☐	
D.	Were samples received in the correct containers?	☒	☐	☐	
	i. Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii. Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?	☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.	☐	☒	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.	☐	☒	☐	
H.	Are lab IDs cross-referenced correctly with the field IDs.	☒	☐	☐	

2. Calibration

Question			Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.		☐	☒	☐	MN limits used. ICAL, ICV and CCV reviewed.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☒	☐	☐	Trip Blank: 812443399253
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☒	☐	
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☐	☒	☐	
	i.	If yes, are the same compounds present in the samples?	☐	☐	☒	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☐	☐	☒	
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☐	☒	

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☐	☒	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances and qualifications. One result was rejected (R) due to a severely low labeled analog recovery.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☐	☒	☐	MPCA PFAS water limits used: 70% to 130%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☐	☐	☒	
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☐	☒	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☐	☒	☐	
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☐	☒	☐	
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*		☐	☐	☒	

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☐	☒	☐	Reduced sample volumes used due to high sample concentrations.

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachment for qualification.

One result was rejected (R) due to a severely low labeled analog recovery.

Certification

By typing my name below, I certify the above statements to be true and correct, to the best of my knowledge, and that this information can be used for the purpose of processing this form.

Data Validation Qualifications for DPWG74712

Labeled Analogs - surrogates (Section 4Bii): Results associated with low recoveries were qualified as estimated (UJ and J+), as these labeled analogs are used to quantitate the analyte of interest and an inverse relationship exists. One result was rejected (R) due to a severely low labeled analog recovery.

Sample ID	Lab ID	Labeled Analog	% Recovery (limits 50% to 200%)	Qualification of Associated non-Labeled Analyte
VB3-FOAM-01-091620	L33798-4	13C5-PFPeA	45.6	J+
VB3-FOAM-01-091620	L33798-4	13C5-PFHxA	48	J+
VB3-FOAM-01-091620	L33798-4	13C4-PFHpA	49	J+
VB3-FOAM-01-091620	L33798-4	13C8-PFOA	44.7	J+
VB3-FOAM-01-091620	L33798-4	13C9-PFNA	45.8	J+
VB3-FOAM-01-091620	L33798-4	13C6-PFDA	40.5	J+
VB3-FOAM-01-091620	L33798-4	13C7-PFUnA	39	J+
VB3-FOAM-01-091620	L33798-4	13C2-PFDoA	30	J+
VB3-FOAM-01-091620	L33798-4	13C2-PFTeDA	17.4	R
VB3-FOAM-01-091620	L33798-4	13C3-PFBS	44.9	UJ
VB3-FOAM-01-091620	L33798-4	13C3-PFHxS	44.9	J+
VB3-FOAM-01-091620	L33798-4	13C8-PFOS	38	J+
VB3-FOAM-01-091620	L33798-4	13C2-6:2 FTS	31.7	UJ
VB3-FOAM-01-091620	L33798-4	13C2-8:2 FTS	30.6	UJ
VB3-FOAM-01-091620	L33798-4	13C8-PFOSA	43.2	J+
VB3-FOAM-01-091620	L33798-4	D3-N-MeFOSA	36.9	UJ

Project information

Project name: Project 1007

Work order number/Lab report ID: DPWG74760 Report date (mm/dd/yyyy): 12/22/2020

Laboratory: SGS AXYS Review date (mm/dd/yyyy): 1/10/2021

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	Additional samples (not reported in this SDG) were listed on the COCs. A trip blank was received, but was not listed on the COC.
B.	Is there a sample condition form with the report?		☒	☐	☐	
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☐	☒	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☒	☐	☐	Case narrative indicates samples were received at greater than 4 °C. Sample receipt was acceptable since they were received within the MPCA requirement of <6 °C.
H.	Are lab IDs cross-referenced correctly with the field IDs.		☒	☐	☐	

2. Calibration

Question			Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.		☐	☒	☐	MN limits used. ICAL, ICV and CCV reviewed.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☒	☐	☐	Trip Blank: 812443399253 (L33798-1) reported in SDG DPWG74712
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☒	☐	No detects
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☒	☐	☐	
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualifications summary for blank detections and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☐	☒	

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances and qualifications. Thrity-one results were rejected (R) due to a severely low labeled analog recovery.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS other limits used: 50% to 150%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances. No qualifiers.
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☒	☐	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSD
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSD
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*		☒	☐	☐	MPCA limit: 50% RPD for tissue (other)

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☒	☐	☐	Laboratory J flags indicating a concentration less than limit of quantification are to be retained during reporting.

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachment for qualification.

Thirty-one results were rejected (R) due to a severely low labeled analog recovery.

Certification

MINNESOTA

Minnesota Department of Agriculture 651-201-6148
Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: DPWG74771 Report date (mm/dd/yyyy): 12/27/2020

Laboratory: SGS AXYS Review date (mm/dd/yyyy): 1/16/2021

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	Additional samples (not reported in this SDG) were listed on the COCs.
B.	Is there a sample condition form with the report?		☒	☐	☐	
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☐	☒	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☐	☒	☐	Case narrative indicates samples were received at greater than 4 °C. Sample receipt was acceptable since they were received within the MPCA requirement of <6 °C.

H.	Are lab IDs cross-referenced correctly with the field IDs.	☒	☐	☐	Sample WL15A-CRAY-EATEN-01-091620 (L33788-37) was not listed on the COC as it was a crayfish pulled from the fish sample WL15A-PRED-WHO-THREE-01-091620 that was reported in SDG DPWG74677 (L33776-49). Descrepancies between the sample ID on the COC and sample labels were noted for 3 samples.

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used. ICAL, ICV and CCV reviewed. See data qualifications summary for exceedances. No qualifiers.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☒	☐	☐	Login report indicates a trip blank L33798-1 was associated with the samples collected (reported in SDG DPWG74712)
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☒	☐	The trip blank results were nondetect
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☒	☐	☐	
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than $1/10^{th}$ of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualifications summary for blank detections and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☐	☒	

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	

	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances and qualifications. Forty results were rejected (R) due to a severely low labeled analog recovery.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS other limits used: 50% to 150%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances. No qualifiers.
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☒	☐	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSD
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	

B.	Was a duplicate sample submitted for the analytical method(s)?		☒	☐	☐	LCSD
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*	☒	☐	☐	MPCA limit: 50% RPD for tissue (other)

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☒	☐	☐	Laboratory J flags indicating a concentration less than limit of quantification are to be retained during reporting.

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachment for qualification.

Forty results were rejected (R) due to a severely low labeled analog recovery.

Certification

By typing my name below, I certify the above statements to be true and correct, to the best of my knowledge, and that this information can be used for the purpose of processing this form.

Data Validation Qualifications for DPWG74771

Calibration (Section 2): Calibration noncompliances are summarized below.

Calibration Date	Analyte	%R	%R Limit	Qualifiers
26-Nov-2020 11:59	NFDHA	147	70-130	Only PFOS and PFOSA dilutions reported from 11/26/20 analyses. No qualifiers.

Method blank detections (Section 3Bii): Detects within 10 times the method blank concentrations were qualified B.

Blank Sample ID	Analyte	Concentration (ng/g)	Results Qualified B
WG74155-101	PFBA	0.508 J	All results were within 10 times the blank concentration and qualified B.
	PFUnA	0.105 J	WL15A-FORE-WHO-THREE-01-091620 (L33784-52) WL15-FORE-WHO-ONE-01-091620 (L33784-54) WL15-FORE-WHO-TWO-01-091620 (L33784-55) WL15-FORE-WHO-THREE-01-091620 (L33784-56) RC16A-FORE-COMP-ONE-01-091920 (L33784-63) RC16A-FORE-COMP-TWO-01-091920 (L33784-64) RC17-FORE-COMP-ONE-01-091920 (L33784-65) RC17-FORE-COMP-TWO-01-091920 (L33784-66) RC18-FORE-COMP-01-091920 (L33784-67) EP15-FORE-WHO-ONE-01-091820 (L33784-70) WL15A-CRAY-EATEN-01-091620 (L33788-37)
	PFOS	0.153 J	Sample concentrations were greater than 10 times the blank concentration. No qualifiers.
	PFOSA	0.109 J	WL15A-FORE-WHO-THREE-01-091620 (L33784-52) WL15A-FORE-WHO-FOUR-01-091620 (L33784-53) WL15-FORE-WHO-ONE-01-091620 (L33784-54) WL15-FORE-WHO-TWO-01-091620 (L33784-55) WL15-FORE-WHO-THREE-01-091620 (L33784-56) RC16A-FORE-COMP-ONE-01-091920 (L33784-63) EP15-FORE-WHO-ONE-01-091820 (L33784-70) WL15A-CRAY-EATEN-01-091620 (L33788-37)

Labeled Analogs - surrogates (Section 4Bii): Results associated with low recoveries were qualified as estimated (UJ and J+), and detects associated with high recoveries were qualified as estimated biased low (J-), as these labeled analogs are used to quantitate the analyte of interest and an inverse relationship exists. Forty results were rejected (R) due to severely low labeled analog recoveries.

Sample ID	Lab ID	Labeled Analog	% Recovery (limits 50% to 200%)	Qualification of Associated non-Labeled Analyte
WL15A-FORE-WHO-THREE-01-091620	L33784-52	13C2-PFTeDA	30.9	J+

Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: DPWG74772 Report date (mm/dd/yyyy): 12/16/2020

Laboratory: SGS AXYS Review date (mm/dd/yyyy): 1/16/2021

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	Additional samples (not reported in this SDG) were listed on the COCs.
B.	Is there a sample condition form with the report?		☒	☐	☐	
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☐	☒	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☐	☒	☐	Case narrative indicates samples were received at greater than 4 °C. Sample receipt was acceptable since they were received within the MPCA requirement of <6 °C.
H.	Are lab IDs cross-referenced correctly with the field IDs.		☒	☐	☐	

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used. ICAL, ICV and CCV reviewed. See data qualifications summary for exceedances and qualifiers.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☒	☐	☐	Equipment Blanks: EQ-CATFOOD-01-100520 (L33799-1) EQ-CHICKEN-01-100520 (L33799-2) Login report indicates a trip blank L33798-1 was associated with the samples collected (reported in SDG DPWG74712)
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☒	☐	☐	EQ-CATFOOD-01-100520 (L33799-1): PFOS detect attributable to laboratory contamination. EQ-CHICKEN-01-100520 (L33799-2): N-EtFOSE 2.11 J ng/g Associated samples not provide. The equipment blank detection will be considered during ecological review of the results. The trip blank results were nondetect
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☒	☐	☐	
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualifications summary for blank detections and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☐	☒	

4. Surrogates or organic analysis

Question		Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?	☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)	☒	☐	☐	

	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances and qualifications. Twenty-eight results were rejected (R) due to a severely low labeled analog recovery.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS other limits used: 50% to 150%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances. No qualifiers.
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☒	☐	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSD
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	

		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSD
	i.		Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*	☒	☐	☐	MPCA limit: 50% RPD for tissue (other)

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☒	☐	☐	Laboratory J flags indicating a concentration less than limit of quantification are to be retained during reporting.

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachment for qualification.

Twenty-eight results were rejected (R) due to a severely low labeled analog recovery.

Certification

By typing my name below, I certify the above statements to be true and correct, to the best of my knowledge, and that this information can be used for the purpose of processing this form.

Labeled Analogs - surrogates (Section 4Bii): Results associated with low recoveries were qualified as estimated (UJ and J+), and detects associated with high recoveries were qualified as estimated biased low (J-), as these labeled analogs are used to quantitate the analyte of interest and an inverse relationship exists. Twenty-eight results were rejected (R) due to severely low labeled analog recoveries.

Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: DPWG74773 Report date (mm/dd/yyyy): 12/16/2020

Laboratory: SGS AXYS Review date (mm/dd/yyyy): 1/17/2021

1. Chain of custody, preservation, and holding times

	Questions	Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?	☒	☐	☐	Additional samples (not reported in this SDG) were listed on the COCs.
B.	Is there a sample condition form with the report?	☒	☐	☐	
C.	Were there samples preserved according to program requirements?	☒	☐	☐	
D.	Were samples received in the correct containers?	☒	☐	☐	
	i. Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii. Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?	☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.	☐	☒	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.	☐	☒	☐	
H.	Are lab IDs cross-referenced correctly with the field IDs.	☒	☐	☐	

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used. ICAL, ICV and CCV reviewed. See data qualifications summary for exceedances. No qualifiers.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☐	☒	☐	
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☐	☒	
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☒	☐	☐	
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualifications summary for blank detections and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☐	☒	

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances and qualifications. Thirty-six results were rejected (R) due to a severely low labeled analog recovery.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS other limits used: 50% to 150%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances. No qualifiers.
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☒	☐	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSD
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSD
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*		☒	☐	☐	MPCA limit: 50% RPD for tissue (other)

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☒	☐	☐	Laboratory J flags indicating a concentration less than limit of quantification are to be retained during reporting.

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	Samples WL7-CRAY-TWO-01-092320, WL7-CRAY-FOUR-01-092320 and WL11-CRAY-01-092120 (SGS AXYS ID: L33788-28, -30 and -35, respectively) were instrumentally re-analyzed for possible sample carry-over impact on PFBA results. The re-analysis data confirmed that the analyte results for PFBA were affected and the results for PFBA were reported from the re-analysis data

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachment for qualification.

Thirty-six results were rejected (R) due to a severely low labeled analog recovery.

Certification

By typing my name below, I certify the above statements to be true and correct, to the best of my knowledge, and that this information can be used for the purpose of processing this form.

Labeled Analogs - surrogates (Section 4Bii): Results associated with low recoveries were qualified as estimated (UJ and J+), and detects associated with high recoveries were qualified as estimated biased low (J-), as these labeled analogs are used to quantitate the analyte of interest and an inverse relationship exists. Thirty-six results were rejected (R) due to severely low labeled analog recoveries.

Minnesota Department of Health 651-201-5357
Minnesota Pollution Control Agency 651-757-2560

Laboratory data review checklist

Doc Type: Data Review

Instructions: The following is the informal checklist that should be used to review data for the Minnesota Department of Agriculture, Minnesota Pollution Control Agency, and Minnesota Department of Health. The information follows the general format of the National Functional Guidelines, which is the primary data review tool used in the U.S. Environmental Protection Agency's Contract Laboratory Program for Superfund analytical work. Refer to the appropriate guidance document for each agency for instructions.

Project information

Project name: Project 1007

Work order number/Lab report ID: DPWG74774 Report date (mm/dd/yyyy): 12/16/2020

Laboratory: SGS AXYS Review date (mm/dd/yyyy): 1/17/2021

1. Chain of custody, preservation, and holding times

Questions			Yes	No	N/A	Comments
A.	Is there a chain of custody (COC) with the report?		☒	☐	☐	Additional samples (not reported in this SDG) were listed on the COCs.
B.	Is there a sample condition form with the report?		☒	☐	☐	
C.	Were there samples preserved according to program requirements?		☒	☐	☐	
D.	Were samples received in the correct containers?		☒	☐	☐	
	i.	Was there enough sample volume/weight to complete all requested analyses?	☒	☐	☐	
	ii.	Was there enough sample collected to complete required batch QC?	☒	☐	☐	
E.	Were samples received within holding time for sample prep for all requested analyses?		☒	☐	☐	
F.	Are there notes about sample condition or holding time issues on the COC? Explain the data impact.		☐	☒	☐	
G.	Are there narration or data qualifiers with the report about sample condition or holding time issues? Explain the data impact.		☐	☒	☐	Case narrative indicates samples were received at greater than 4 °C. Sample receipt was acceptable since they were received within the MPCA requirement of <6 °C.
H.	Are lab IDs cross-referenced correctly with the field IDs.		☒	☐	☐	The laboratory indicated one sample ID on the COC did not match the sample label. The sample was logged in per COC.

2. Calibration

Question		Yes	No	N/A	Comments
A.	Do the report narrative or data qualifiers indicate calibration problems for any analyses? If yes, explain the data impact.	☒	☐	☐	MN limits used. ICAL, ICV and CCV reviewed. See data qualifications summary for exceedances. No qualifiers.

3. Blanks

Question			Yes	No	N/A	Comments
A.	Do any of the analyses contain samples for field or trip blanks?		☐	☒	☐	
	i.	If yes, are there target analytes present above the reporting limit in the blanks?	☐	☐	☒	
	ii.	If yes, are the same compounds also present in the samples? Explain possible data impact.	☐	☐	☒	
B.	Do method blanks for any analyses contain target analytes above the reporting limit?		☒	☐	☐	
	i.	If yes, are the same compounds present in the samples?	☒	☐	☐	
	ii.	Is the amount of target analyte in the method blank more than 1/10th of that in the sample(s)? Explain the possible impact on sample results.	☒	☐	☐	See data qualifications summary for blank detections and qualifications.
C.	Do instrument blanks contain analytes above the reporting limit?		☐	☐	☒	

4. Surrogates or organic analysis

Question			Yes	No	N/A	Comments
A.	Are the lab recovery limits for surrogates specified on the report?		☒	☐	☐	MPCA limits used: 50% to 200%
B.	Are the surrogates outside lab QC limits? (These should have a data qualifier.)		☒	☐	☐	
	i.	If yes, are the surrogates above the lab QC limits?	☒	☐	☐	
	ii.	Below the lab QC limits?	☒	☐	☐	
	iii.	Were the affected samples re-analyzed? Discuss in the case narrative.	☐	☒	☐	
	iv.	Explain what this could mean for the affected samples. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances and qualifications. Thirty-three results were rejected (R) due to a severely low labeled analog recovery.

5. Laboratory control sample/Laboratory control sample duplicate (LCS/LCSD)

Question			Yes	No	N/A	Comments
A.	Are there LCS/LCSD samples present for the reporting analyses?		☒	☐	☐	
B.	Are there LCS/LCSD compounds outside lab limits? If the LCS/LCSD fails, the LCS/LCSD and samples must be re-analyzed.		☒	☐	☐	MPCA PFAS other limits used: 50% to 150%.
	i.	If yes, are there compounds above the lab QC limits? If yes, an explanation is required. Include in narrative.	☒	☐	☐	See data qualifications summary for exceedances and qualifications.
	ii.	Below the QC limits? If yes, an explanation is required. Include in narrative.	☐	☒	☐	

6. Matrix spike/Matrix spike duplicate/Sample duplicate (MS/MSD/DUP)

Question				Yes	No	N/A	Comments
A.	Do the analytical methods used require an MS and/or MSD? If no, skip to 6.B.			☒	☐	☐	
	i.	Have the required matrix spikes been prepared and reported?		☐	☒	☐	
	ii.	If no, is there and explanation in the report as to why?		☐	☒	☐	
	iii.	Did the lab process an alternate spiked sample (such as LCSD) instead?		☒	☐	☐	LCSD
	iv.	Are the lab QC limits specified on the report?		☒	☐	☐	
	v.	Are there compounds outside the lab QC limits?		☐	☐	☒	
	vi.	If yes, did the lab re-run an MS/MSD?		☐	☐	☒	
		1.	Did the re-run MS/MSD pass? Discuss the case narrative.	☐	☐	☒	
		2.	Did the re-run MS/MSD fail? Discuss the case narrative.	☐	☐	☒	
		3.	Is the source sample also flagged for MS/MSD compounds outside the lab QC limits?	☐	☐	☒	
B.	Was a duplicate sample submitted for the analytical method(s)?			☒	☐	☐	LCSD
	i.	Is the Relative Percentage Difference (RPD) within 20%* for the duplicate pair? If no, explain possible causes and data impact. **Other RPDs may be acceptable. Check with regulatory agency.*		☐	☒	☐	MPCA limit: 50% RPD for tissue (other) LCSD: See data qualifications summary for exceedances and qualifications.

7. Method detection limits/Report limits

Question		Yes	No	N/A	Comments
A.	Are reporting limits clearly listed on the report for all analyses?	☒	☐	☐	
B.	Do the reporting limits meet the program required limits listed? If not, an explanation is required.	☐	☒	☐	Laboratory J flags indicating a concentration less than limit of quantification are to be retained during reporting. Five samples were analyzed with a sample size less of than 2 grams resulting in elevated reporting limits.

8. Sample information

Questions		Yes	No	N/A	Comments
A.	Are sample numbers cross-referenced correctly with the associated QC?	☒	☐	☐	
B.	Are soil samples reported in dry weight basis?	☐	☐	☒	
C.	Are percent moisture results reported?	☐	☐	☒	
D.	Are positive detections reported?	☒	☐	☐	
E.	Are sample analytes appropriately flagged if the QC failed?	☒	☐	☐	

9. Report narrative

Question		Yes	No	N/A	Comments
A.	Is a narrative provided with the laboratory report which describes all problems with the analyses and all corrective actions taken to address these problems?	☒	☐	☐	

10. Additional comments about the lab report

Reviewed using MPCA Guidance on Perfluorochemicals Analysis (July 2020).

See attachment for qualification.

Thirty-three results were rejected (R) due to a severely low labeled analog recovery.

Certification

By typing my name below, I certify the above statements to be true and correct, to the best of my knowledge, and that this information can be used for the purpose of processing this form.

Authorized Representative

Name: Lisa Smith Title: Environmental Chemist (CEAC)

(This document has been electronically signed.) Date (mm/dd/yyyy): 1/17/2021

Data Validation Qualifications for DPWG74774

Calibration (Section 2): Calibration noncompliances are summarized below.

Calibration Date	Analyte	%R	%R Limit	Qualifiers
13-Nov-2020 12:14	NFDHA	144	70-130	Associated results were nondetect. No qualifiers.
23-Nov-2020 15:58	3:3 FTCA	58.4	70-130	Only PFOS reported from 11/23/20.
	NFDHA	132	70-130	
23-Nov-2020 20:18	3:3 FTCA	0.1	70-130	

Method blank detections (Section 3Bii): Detects within 10 times the method blank concentrations were qualified B.

Blank Sample ID	Analyte	Concentration (ng/g)	Results Qualified B
WG74159-101	PFUnA	0.139 J	All PFUnA sample results were qualified B.
	PFTrDA	0.198 J	RC3A-SNAIL-COMP-01-092420 (L33791-1) RC4A-AMPH-COMP-01-091820 (L33792-1) RC5-AMPH-ONE-01-091820 (L33792-2) RC5-AMPH-TWO-01-092220 (L33792-3) RC6A-AMPH-01-092020 (L33792-4) RC3A-AMPH-COMP-ONE-01-091920 (L33792-5) RC7-AMPH-01-092220 (L33792-6) RC13-AMPH-01-092120 (L33792-7) RC16A-AMPH-01-091920 (L33792-8) RC17A-AMPH-01-092120 (L33792-9) RC18-AMPH-01-091520 (L33792-10) WL2-AMPH-01-092220 (L33792-12) WL8A-AMPH-01-092520 (L33792-13)
	PFOS	0.173 J	Sample concentrations were greater than ten times the blank concentration. No qualifiers.
	PFOSA	0.101 J	RC17A-AMPH-01-092120 (L33792-9) EP19-AMPH-01-091920 (L33792-11) WL8A-AMPH-01-092520 (L33792-13)

Labeled Analogs - surrogates (Section 4Bii): Results associated with low recoveries were qualified as estimated (UJ and J+), and detects associated with high recoveries were qualified as estimated biased low (J-), as these labeled analogs are used to quantitate the analyte of interest and an inverse relationship exists. Thirty-three results were rejected (R) due to severely low labeled analog recoveries.

Acronyms:
EPC - Exposure Point Concentration.
NC - Not Calculated.
ND - Not Detected.
UCL - Upper confidence limit.
ug/kg - Micrograms per kilograms.
USEPA - United States Environmental Protection Agency.
Notes:
(a) Upper Confidence Limit (UCL) on the arithmetic mean concentration calculated using USEPA ProUCL Version 5.1. The UCL suggested by ProUCL is used, unless otherwise noted. In cases where more than one UCL is suggested, the higher UCL is used. A sample size of at least eight is recommended for the calculation of UCLs. When fewer samples are available the ProUCL export is reviewed to assess whether the maximum or the recommended UCL is the appropriate EPC
(b) Chemical was not detected.
(c) A UCL was not calculated analyte in this location.

Acronyms:

EPC - Exposure Point Concentration.

NC - Not Calculated.

ND - Not Detected.

UCL - Upper confidence limit.

ug/kg - Micrograms per kilograms.

USEPA - United States Environmental Protection Agency.

Notes:

(a) Upper Confidence Limit (UCL) on the arithmetic mean concentration calculated using USEPA ProUCL Version 5.1. The UCL suggested by ProUCL is used, unless otherwise noted. In cases where more than one UCL is suggested, the higher UCL is used. A sample size of at least eight is recommended for the calculation of UCLs. When fewer samples are available the ProUCL export is reviewed to assess whether the maximum or the recommended UCL is the appropriate EPC

(b) Chemical was not detected.

(c) A UCL was not calculated analyte in this location.

Acronyms:
EPC - Exposure Point Concentration.
NC - Not Calculated.
ND - Not Detected.
UCL - Upper confidence limit.
ug/kg - Micrograms per kilograms.
USEPA - United States Environmental Protection Agency.
Notes:
(a) Upper Confidence Limit (UCL) on the arithmetic mean concentration calculated using USEPA ProUCL Version 5.1. The UCL suggested by ProUCL is used, unless otherwise noted. In cases where more than one UCL is suggested, the higher UCL is used. A sample size of at least eight is recommended for the calculation of UCLs. When fewer samples are available the ProUCL export is reviewed to assess whether the maximum or the recommended UCL is the appropriate EPC
(b) Chemical was not detected.

Acronyms:

EPC - Exposure Point Concentration.

NC - Not Calculated.

ND - Not Detected.

UCL - Upper confidence limit.

ug/kg - Micrograms per kilograms.

USEPA - United States Environmental Protection Agency.

Notes:

(a) Upper Confidence Limit (UCL) on the arithmetic mean concentration calculated using USEPA ProUCL Version 5.1. The UCL suggested by ProUCL is used, unless otherwise noted. In cases where more than one UCL is suggested, the higher UCL is used. A sample size of at least eight is recommended for the calculation of UCLs. When fewer samples are available the ProUCL export is reviewed to assess whether the maximum or the recommended UCL is the appropriate EPC

(b) Chemical was not detected.

(c) A UCL was not calculated analyte in this location.

Acronyms:
EPC - Exposure Point Concentration.
NC - Not Calculated.
ND - Not Detected.
UCL - Upper confidence limit.
ug/kg - Micrograms per kilograms.
USEPA - United States Environmental Protection Agency.
Notes:
(a) Upper Confidence Limit (UCL) on the arithmetic mean concentration calculated using USEPA ProUCL Version 5.1. The UCL suggested by ProUCL is used, unless otherwise noted. In cases where more than one UCL is suggested, the higher UCL is used. A sample size of at least eight is recommended for the calculation of UCLs. When fewer samples are available the ProUCL export is reviewed to assess whether the maximum or the recommended UCL is the appropriate EPC
(c) Chemical was not detected.

Acronyms:
COPEC - Contaminant of Potential Ecological Concern.
EPC - Exposure Point Concentration.
NC - Not Calculated.
ND - Not Detected.
UCL - Upper confidence limit.
ug/kg - Micrograms per kilograms.
USEPA - United States Environmental Protection Agency.

Notes:
(a) Upper Confidence Limit (UCL) on the arithmetic mean concentration calculated using USEPA ProUCL Version 5.1. The UCL suggested by ProUCL is used, unless otherwise noted. In cases where more than one UCL is suggested, the higher UCL is used. A sample size of at least eight is recommended for the calculation of UCLs. When fewer samples are available the ProUCL export is reviewed to assess whether the maximum or the recommended UCL is the appropriate EPC
(c) Chemical was not detected.

Acronyms:
EPC - Exposure Point Concentration.
NC - Not Calculated.
ND - Not Detected.
UCL - Upper confidence limit.
ug/kg - Micrograms per kilograms.
USEPA - United States Environmental Protection Agency.

Notes:
(a) Upper Confidence Limit (UCL) on the arithmetic mean concentration calculated using USEPA ProUCL Version 5.1. The UCL suggested by ProUCL is used, unless otherwise noted. In cases where more than one UCL is suggested, the higher UCL is used. A sample size of at least eight is recommended for the calculation of UCLs. When fewer samples are available the ProUCL export is reviewed to assess whether the maximum or the recommended UCL is the appropriate EPC
(c) Chemical was not detected.

Acronyms:
EPC - Exposure Point Concentration.
NC - Not Calculated.
ND - Not Detected.
UCL - Upper confidence limit.
ug/kg - Micrograms per kilograms.
USEPA - United States Environmental Protection Agency.

Notes:
(a) Upper Confidence Limit (UCL) on the arithmetic mean concentration calculated using USEPA ProUCL Version 5.1. The UCL suggested by ProUCL is used, unless otherwise noted. In cases where more than one UCL is suggested, the higher UCL is used. A sample size of at least eight is recommended for the calculation of UCLs. When fewer samples are available the ProUCL export is reviewed to assess whether the maximum or the recommended UCL is the appropriate EPC
(c) Chemical was not detected.

Acronyms:
EPC - Exposure Point Concentration.
NC - Not Calculated.
ND - Not Detected.
UCL - Upper confidence limit.
ug/kg - Micrograms per kilograms.
USEPA - United States Environmental Protection Agency.

Notes:
(a) Upper Confidence Limit (UCL) on the arithmetic mean concentration calculated using USEPA ProUCL Version 5.1. The UCL suggested by ProUCL is used, unless otherwise noted. In cases where more than one UCL is suggested, the higher UCL is used. A sample size of at least eight is recommended for the calculation of UCLs. When fewer samples are available the ProUCL export is reviewed to assess whether the maximum or the recommended UCL is the appropriate EPC
(c) Chemical was not detected.

Acronyms:
EPC - Exposure Point Concentration.
NC - Not Calculated.
ND - Not Detected.
UCL - Upper confidence limit.
ug/kg - Micrograms per kilograms.
USEPA - United States Environmental Protection Agency.

Notes:
(a) Upper Confidence Limit (UCL) on the arithmetic mean concentration calculated using USEPA ProUCL Version 5.1. The UCL suggested by ProUCL is used, unless otherwise noted. In cases where more than one UCL is suggested, the higher UCL is used. A sample size of at least eight is recommended for the calculation of UCLs. When fewer samples are available the ProUCL export is reviewed to assess whether the maximum or the recommended UCL is the appropriate EPC
(b) Chemical was not detected.

Suggested UCL to Use

95% Student's-t UCL 0.118

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Student's-t UCL 0.0124

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% KM (t) UCL 0.00114

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

95% KM (t) UCL 0.00475

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% Student's-t UCL 0.00991

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Student's-t UCL 0.0141

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL	7.07E-04

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

95% H-UCL 0.0482

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% KM (t) UCL 0.00315

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.00159

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% Student's-t UCL 0.406 or 95% Modified-t UCL 0.406

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Detected Data Not Gamma Distributed at 5% Significance Level

Gamma Statistics on Detected Data Only

k hat (MLE)	9.875	k star (bias corrected MLE)	9.392
Theta hat (MLE)	1.2076E-4	Theta star (bias corrected MLE)	1.2697E-4
nu hat (MLE)	1185	nu star (bias corrected)	1127
Mean (detects)	0.00119		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	7.6800E-4	Mean	0.00356
Maximum	0.01	Median	0.00121
SD	0.00394	CV	1.109
k hat (MLE)	1.028	k star (bias corrected MLE)	0.999
Theta hat (MLE)	0.00346	Theta star (bias corrected MLE)	0.00356
nu hat (MLE)	168.6	nu star (bias corrected)	163.8
Adjusted Level of Significance (β)	0.0471		
Approximate Chi Square Value (163.78, α)	135.2	Adjusted Chi Square Value (163.78, β)	134.7
95% Gamma Approximate UCL (use when n>=50)	0.00431	95% Gamma Adjusted UCL (use when n<50)	0.00432
