Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 5.57E-04

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Student's-t UCL 0.00954 or 95% Modified-t UCL 0.00954

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Mean (detects)	0.00521		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

ProUCL Output
Eagle Point Lake
Dissolved Surface Water

Suggested UCL to Use

95% KM (t) UCL 4.10E-04

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL Output

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Student's-t UCL 0.023

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Student's-t UCL	0.00114

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.499

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Gamma Distributed at 5% Significance Level

Suggested UCL to Use

ı Adjusted KM-UCL (use when k<=1 and 15 < n < 50 but k<=1) 0.971

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.26

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.594

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

General Statistics

Total Number of Observations	8	Number of Distinct Observations	8
		Number of Missing Observations	0
Minimum	0.619	Mean	2.045
Maximum	4.97	Median	1.11
SD	1.74	Std. Error of Mean	0.615
Coefficient of Variation	0.851	Skewness	1.111

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.0965

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% Adjusted Gamma UCL 154.4

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

ı Adjusted KM-UCL (use when k<=1 and 15 < n < 50 but k<=1) 8.626

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Gamma Distributed at 5% Significance Level

Suggested UCL to Use

95% KM Adjusted Gamma UCL	0.207	95% GROS Adjusted Gamma UCL	0.167

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% KM (t) UCL 0.331

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test on Detects Only

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.0031	Mean	0.00527

Suggested UCL to Use

95% Student's-t UCL 1.954

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.00177

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.549

Coefficient of Variation	0.835	Skewness	1.29

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
Number of Detects	4	Number of Non-Detects	2
Number of Distinct Detects	4	Number of Distinct Non-Detects	2
Minimum Detect	0.123	Minimum Non-Detect	0.0939
Maximum Detect	0.284	Maximum Non-Detect	0.0948
Variance Detects	0.0044	Percent Non-Detects	33.33%
Mean Detects	0.197	SD Detects	0.0664
Median Detects	0.191	CV Detects	0.336
Skewness Detects	0.55	Kurtosis Detects	1.456
Mean of Logged Detects	-1.667	SD of Logged Detects	0.343

Note: Sample size is small (e.g., <10), If data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test on Detects Only

Shapiro Wilk Test Statistic	0.966	**Shapiro Wilk GOF Test**

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Student's-t UCL 0.252

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

General Statistics

Total Number of Observations	9	Number of Distinct Observations	9
		Number of Missing Observations	0
Minimum	0.135	Mean	0.207
Maximum	0.316	Median	0.216
SD	0.0585	Std. Error of Mean	0.0195
Coefficient of Variation	0.283	Skewness	0.445

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Skewness Detects	0.801	Kurtosis Detects	-1.557
Mean of Logged Detects	-1.225	SD of Logged Detects	0.0764

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest. For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012). Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test on Detects Only

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.23	Mean	0.267
Maximum	0.324	Median	0.276
SD	0.0379	CV	0.142
k hat (MLE)	58.49	k star (bias corrected MLE)	33.52

Suggested UCL to Use

95% Student's-t UCL	1.448

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.0596	Mean	0.159

General Statistics

Total Number of Observations	7	Number of Distinct Observations	7
		Number of Missing Observations	0
Minimum	56.5	Mean	81.8
Maximum	105	Median	75.6
SD	17.96	Std. Error of Mean	6.788
Coefficient of Variation	0.22	Skewness	0.209

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.0806
Maximum	0.305	Median	0.01

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL	0.164

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Suggested UCL to Use

95% H-UCL	6.164

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Suggested UCL to Use

95% Student's-t UCL 0.401

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.235

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	1.1	Mean	2.085
Maximum	5.12	Median	1.535
SD	1.52	Std. Error of Mean	0.621
Coefficient of Variation	0.729	Skewness	2.221

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.326

Suggested UCL to Use

95% Student's-t UCL 8.096

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Student's-t UCL 2.119

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.27

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

97.5% Chebyshev(Mean, Sd) UCL	1.988	99% Chebyshev(Mean, Sd) UCL	2.889

Suggested UCL to Use

95% Hall's Bootstrap UCL	2.713

Recommended UCL exceeds the maximum observation

In Case Bootstrap t and/or Hall's Bootstrap yields an unreasonably large UCL value, use 97.5% or 99% Chebyshev (Mean, Sd) UCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	1.169

97.5% Chebyshev(Mean, Sd) UCL	2.972	99% Chebyshev(Mean, Sd) UCL	4.015

Suggested UCL to Use

95% Student's-t UCL 1.781

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Nonparametric Distribution Free UCL Statistics

Detected Data appear Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.458

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

General Statistics

Total Number of Observations	7	Number of Distinct Observations	7
		Number of Missing Observations	0
Minimum	0.539	Mean	2.446
Maximum	5.52	Median	1.77
SD	1.949	Std. Error of Mean	0.737
Coefficient of Variation	0.797	Skewness	0.903

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Adjusted Gamma UCL 0.454

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.14

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.0557	Mean	0.112

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

DL/2 is not a recommended method, provided for comparisons and historical reasons

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 0.354

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Skewness Detects	0.652	Kurtosis Detects	-1.008
Mean of Logged Detects	-1.302	SD of Logged Detects	0.677

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

97.5% Chebyshev(Mean, Sd) UCL	2363	99% Chebyshev(Mean, Sd) UCL	3055

Suggested UCL to Use

95% Student's-t UCL	1551	or 95% Modified-t UCL	1566
or 95% H-UCL	1653		

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

General Statistics

Total Number of Observations	8	Number of Distinct Observations	8
		Number of Missing Observations	0
Minimum	0.147	Mean	0.253
Maximum	0.459	Median	0.21
SD	0.105	Std. Error of Mean	0.037
Coefficient of Variation	0.413	Skewness	1.357

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Suggested UCL to Use

95% Student's-t UCL 0.323

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Student's-t UCL 1.502

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

General Statistics

Total Number of Observations	8	Number of Distinct Observations	8
		Number of Missing Observations	0
Minimum	0.277	Mean	0.815
Maximum	1.53	Median	0.861
SD	0.429	Std. Error of Mean	0.152
Coefficient of Variation	0.526	Skewness	0.296

Note: Sample size is small (e.g., <10), If data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest. For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012). Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Student's-t UCL	0.459	or 95% Modified-t UCL	0.458
or 95% H-UCL	0.517		

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Student's-t UCL 1435

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Appendix E

Project 1007-Specific Bioaccumulation Factors Used in the BERA

Appendix E Table 1
Calculation of Amphibian Tissue - Total Surface Water Bioaccumulation Factors
Project 1007
Minneapolis, Minnesota

	Amphibian Tissue Samples (a)								
Area	Sample Name	Sample Date	CAS	Analyte	Detected Tissue Concentration (ug/kg)	Qualifier	Surface Water Geomean (ug/L) (b)	Decision to Calculate BAF?	Calculation of Amphibian to Surface Water BAF (AM/SW) (c)

Notes:
AM - Amphibian Tissue Concentration.
BAF - Bioaccumulation Factor.
CAS - Chemical Abstract Service number.
NC - Not calculated.
ND - Not detected.
SW - Surface Water (total phase).
ug/L - micrograms per liter (ug/L).
ug/kg - microgram per kilogram
+ - Result may be biased high.
B - Analyte was present in a blank.
J - Estimated concentration.
U - Concentration is less than the laboratory reportable limit.

(a) BAFs were calculated for analytes that were detected in Lake Elmo and Eagle Point Lake surface water (total phase) and were included in the food web model. All amphibian tissue samples collected in each area were included in the calculation.
(b) Geometric means (geomeans) of detected surface water concentrations (total phase) were calculated for each analyte per area.
(c) BAFs were calculated for each analyte per amphibian tissue sample per area by dividing the detected concentration in amphibian tissue by the total surface water geometric mean calculated for that area.

Notes:

BAF - Bioaccumulation Factor.
CAS - Chemical Abstract Service number.
CR - Crayfish Tissue Concentration.
NC - Not calculated.
ND - Not detected.
SW - Surface Water (total phase).
ug/L - micrograms per liter (ug/L).
ug/kg - microgram per kilogram
+ - Result may be biased high.
- - Result may be biased low.
B - Analyte was present in a blank.
J - Estimated concentration.
U - Concentration is less than the laboratory reportable limit.

(a) BAFs were calculated for analytes that were detected in Lake Elmo and Eagle Point Lake surface water (total phase)and were included in the food web model. All crayfish tissue samples collected in each area were included in the calculation.
(b) Geometric means (geomeans) of detected surface water concentrations (total phase) were calculated for each analyte per area.
(c) BAFs were calculated for each analyte per crayfish tissue sample per area by dividing the detected concentration in crayfish tissue by the total surface water geomean calculated for that area.

N-MeFOSAA	241	Raleigh Creek - Upper	321	Raleigh Creek - Upper

Notes:
AM - Amphibian Tissue Concentration.
BAF - Bioaccumulation Factor. Calculated as tissue divided by surface water concentration.
CR - Crayfish Tissue Concentration.
Geomean - Geometric Mean.
NC - Not calculated.
ND - Not detected.
SW - Surface Water (total phase).

(a) The geomean of individual AM/SW BAFs and CR/SW BAFs calculated for the areas indicated.
Individual AM/SW and CR/SW BAFs calculated for each tissue sample are presented in Tables 1 and 2 of Appendix E.
(b) Total surface water concentrations detected in Lake Elmo are comparable to Eagle Point Lake and West Lakeland. Therefore, individual BAFs were selected from Eagle Point Lake and West Lakeland, when available, for the calculation of the geomean BAF per analyte. Individual BAFs for Raleigh Creek - upper and Raleigh Creek - other were used when insufficient individual BAFs were available.
(c) The geomean BAFs for PFBA were calculated based on individual BAFs from Raleigh Creek - Upper and West Lakeland Areas for which surface water concentrations were comparable to Lake Elmo.

Notes:
µg/kg - micrograms per kilogram
µg/L - micrograms per liter
-- No Ecological Screening Value
CAS - Chemical Abstracts Service
ESV - Ecological Screening Value
Surrogate ESVs were selected when PFAS-specific ESVS were not available. Surrogates were selected based on carbon chain length and PFAS classification.

1 - Hazardous Concentration 1% (HC1) (Conder, et al., 2020).
2 - Chronic recommended water quality (RWQ) risk-based screening level (RBSL)(Divine, et al., 2020).
3 - Aquatic risk-based screening level for wildlife. Selected level is the lowest of the values derived by Devine, et al (2020) for the muskrat, little brown bat, river otter, mink, red-winged blackbird, tree swallow, and brown pelican.
4 - No toxic effects level for benthic invertebrates (NPCA, 2008).
5 - PFOS (long-chain PFSA) used as a surrogate.
6 - PFOA (long-chain PFCA) used as a surrogate.
7 - PFBA (short-chain PFCA) used as a surrogate.
8 - PFBS (short-chain PFSA) used as a surrogate.
9 - PFNA (long-chain PFCA) used as a surrogate.
10 - PFDA (long-chain PFCA) used as a surrogate.
11 - PFDoA (long-chain PFCA) used as a surrogate.
12 - PFHxA (short-chain PFCA) used as a surrogate.
13 - PFPeA (short-chain PFCA) used as a surrogate.
14 - PFUNA (long-chain PFCA) used as a surrogate.

Notes:
-- Not Available/Applicable.
ug/L - micrograms per liter.
B - Analyte was present in a blank.
EPC - Exposure Point Concentration (see Appendix D for EPC calculations; if sufficient samples are available, the EPC is an upper confidence limit (UCL); maximum detected concentration is the EPC if a UCL cannot be calculated).
ESV - Ecological Screening Value (see Appendix F Table 1 for ESVs).
FOD - Frequency of Detection: Total number of detects - Total number of samples.
J - Analyte positively detected but value is an approximate concentration.
J+ - The chemical was positively identified; however, the associated numerical value is a high estimated concentration.
J- - The chemical was positively identified; however, the associated numerical value is a low estimated concentration.
NC - Not Calculated.
ND - Not Detected.

Source Footnotes -
1 - Hazardous Concentration 1% (HC1) (Conder, et al., 2020a).
2 - Chronic recommended water quality (RWQ) risk-based screening level (RBSL)(Divine, et al., 2020).
3 - Aquatic risk-based screening level for wildlife. Selected level is the lowest of the values derived by Devine, et al (2020) for the muskrat, little brown bat, river otter, mink, red-winged blackbird, tree swallow, and brown pelican.
Surrogate footnotes 5, 6, 7, 8, 9, 10, 12 and 14 are provided on Appendix F Table 1.

Notes:
-- Not Available/Applicable.
ug/L - micrograms per liter.
B - Analyte was present in a blank.
EPC - Exposure Point Concentration (see Appendix D for EPC calculations; if sufficient samples are available, the EPC is an upper confidence limit (UCL); maximum detected concentration is the EPC if a UCL cannot be calculated).
ESV - Ecological Screening Value (see Appendix F Table 1 for ESVs).
FOD - Frequency of Detection: Total number of detects - Total number of samples.
J - Analyte positively detected but value is an approximate concentration.
J+ - The chemical was positively identified; however, the associated numerical value is a high estimated concentration.
J- - The chemical was positively identified; however, the associated numerical value is a low estimated concentration.
NC - Not Calculated.
ND - Not Detected.

Source Footnotes -
1 - Hazardous Concentration 1% (HC1) (Conder, et al., 2020a).
2 - Chronic recommended water quality (RWQ) risk-based screening level (RBSL)(Divine, et al., 2020).
3 - Aquatic risk-based screening level for wildlife. Selected level is the lowest of the values derived by Devine, et al (2020) for the muskrat, little brown bat, river otter, mink, red-winged blackbird, tree swallow, and brown pelican.
Surrogate footnotes 5, 6, 7, 8, 9, 10, 12 and 14 are provided on Appendix F Table 1.

Notes:
-- Not Available/Applicable.
ug/L - micrograms per liter.
B - Analyte was present in a blank.
EPC - Exposure Point Concentration (see Appendix D for EPC calculations; if sufficient samples are available, the EPC is an upper confidence limit (UCL); maximum detected concentration is the EPC if a UCL cannot be calculated).
ESV - Ecological Screening Value (see Appendix F Table 1 for ESVs).
FOD - Frequency of Detection: Total number of detects - Total number of samples.
J - Analyte positively detected but value is an approximate concentration.
J+ - The chemical was positively identified; however, the associated numerical value is a high estimated concentration.
J- - The chemical was positively identified; however, the associated numerical value is a low estimated concentration.
NC - Not Calculated.
ND - Not Detected.

Source Footnotes -
1 - Hazardous Concentration 1% (HC1) (Conder, et al., 2020a).
2 - Chronic recommended water quality (RWQ) risk-based screening level (RBSL)(Divine, et al., 2020).
3 - Aquatic risk-based screening level for wildlife. Selected level is the lowest of the values derived by Devine, et al (2020) for the muskrat, little brown bat, river otter, mink, red-winged blackbird, tree swallow, and brown pelican.
Surrogate footnotes 5, 6, 7, 8, 9, 10, 12 and 14 are provided on Appendix F Table 1.

Notes:
-- Not Available/Applicable.
ug/L - micrograms per liter.
B - Analyte was present in a blank.
EPC - Exposure Point Concentration (see Appendix D for EPC calculations; if sufficient samples are available, the EPC is an upper confidence limit (UCL); maximum detected concentration is the EPC if a UCL cannot be calculated).
ESV - Ecological Screening Value (see Appendix F Table 1 for ESVs).
FOD - Frequency of Detection: Total number of detects - Total number of samples.
J - Analyte positively detected but value is an approximate concentration.
J+ - The chemical was positively identified; however, the associated numerical value is a high estimated concentration.
J- - The chemical was positively identified; however, the associated numerical value is a low estimated concentration.
NC - Not Calculated.
ND - Not Detected.

Source Footnotes -
1 - Hazardous Concentration 1% (HC1) (Conder, et al., 2020a).
2 - Chronic recommended water quality (RWQ) risk-based screening level (RBSL)(Divine, et al., 2020).
3 - Aquatic risk-based screening level for wildlife. Selected level is the lowest of the values derived by Devine, et al (2020) for the muskrat, little brown bat, river otter, mink, red-winged blackbird, tree swallow, and brown pelican.
Surrogate footnotes 5, 6, 7, 8, 9, 10, 12 and 14 are provided on Appendix F Table 1.

Notes:
-- Not Available/Applicable.
ug/kg - micrograms per kilogram.
B - Analyte was present in a blank.
EPC - Exposure Point Concentration (see Appendix D for EPC calculations; if sufficient samples are available, the EPC is an upper confidence limit (UCL); maximum detected concentration is the EPC if a UCL cannot be calculated).
ESV - Ecological Screening Value (see Appendix F Table 1 for ESVs).
FOD - Frequency of Detection: Total number of detects - Total number of samples.
J - Analyte positively detected but value is an approximate concentration.
J+ - The chemical was positively identified; however, the associated numerical value is a high estimated concentration.
J- - The chemical was positively identified; however, the associated numerical value is a low estimated concentration.
NC - Not Calculated.
ND - Not Detected.

Source Footnotes -
3 - Aquatic risk-based screening level for wildlife. Selected level is the lowest of the values derived by Devine, et al (2020) for the muskrat, little brown bat, river otter, mink, red-winged blackbird, tree swallow, and brown pelican.
4 - No toxic effects level for benthic invertebrates (NPCA, 2008).
Surrogate footnotes 5, 6, 7, 8, 9, and 12 are provided on Appendix F Table 1.

Notes:
-- Not Available/Applicable.
ug/kg - micrograms per kilogram.
B - Analyte was present in a blank.
EPC - Exposure Point Concentration (see Appendix D for EPC calculations; if sufficient samples are available, the EPC is an upper confidence limit (UCL); maximum detected concentration is the EPC if a UCL cannot be calculated).
ESV - Ecological Screening Value (see Appendix F Table 1 for ESVs).
FOD - Frequency of Detection: Total number of detects - Total number of samples.
J - Analyte positively detected but value is an approximate concentration.
J+ - The chemical was positively identified; however, the associated numerical value is a high estimated concentration.
J- - The chemical was positively identified; however, the associated numerical value is a low estimated concentration.
NC - Not Calculated.
ND - Not Detected.

Source Footnotes -
3 - Aquatic risk-based screening level for wildlife. Selected level is the lowest of the values derived by Devine, et al (2020) for the muskrat, little brown bat, river otter, mink, red-winged blackbird, tree swallow, and brown pelican.
4 - No toxic effects level for benthic invertebrates (NPCA, 2008).
Surrogate footnotes 5, 6, 7, 8, 9, and 12 are provided on Appendix F Table 1.

Notes:
-- Not Available/Applicable.
ug/kg - micrograms per kilogram.
B - Analyte was present in a blank.
EPC - Exposure Point Concentration (see Appendix D for EPC calculations; if sufficient samples are available, the EPC is an upper confidence limit (UCL); maximum detected concentration is the EPC if a UCL cannot be calculated).
ESV - Ecological Screening Value (see Appendix F Table 1 for ESVs).
FOD - Frequency of Detection: Total number of detects - Total number of samples.
J - Analyte positively detected but value is an approximate concentration.
J+ - The chemical was positively identified; however, the associated numerical value is a high estimated concentration.
J- - The chemical was positively identified; however, the associated numerical value is a low estimated concentration.
NC - Not Calculated.
ND - Not Detected.

Source Footnotes -
3 - Aquatic risk-based screening level for wildlife. Selected level is the lowest of the values derived by Devine, et al (2020) for the muskrat, little brown bat, river otter, mink, red-winged blackbird, tree swallow, and brown pelican.
4 - No toxic effects level for benthic invertebrates (NPCA, 2008).
Surrogate footnotes 5, 6, 7, 8, 9, and 12 are provided on Appendix F Table 1.

Notes:
-- Not Available/Applicable.
ug/L - micrograms per liter.
B - Analyte was present in a blank.
EPC - Exposure Point Concentration (see Appendix D for EPC calculations; if sufficient samples are available, the EPC is an upper confidence limit (UCL); maximum detected concentration is the EPC if a UCL cannot be calculated).
ESV - Ecological Screening Value (see Appendix F Table 1 for ESVs).
FOD - Frequency of Detection: Total number of detects - Total number of samples.
J - Analyte positively detected but value is an approximate concentration.
J+ - The chemical was positively identified; however, the associated numerical value is a high estimated concentration.
J- - The chemical was positively identified; however, the associated numerical value is a low estimated concentration.
NC - Not Calculated.
ND - Not Detected.

Source Footnotes -
1 - Hazardous Concentration 1% (HC1) (Conder, et al., 2020a).
2 - Chronic recommended water quality (RWQ) risk-based screening level (RBSL)(Divine, et al., 2020).
3 - Aquatic risk-based screening level for wildlife. Selected level is the lowest of the values derived by Devine, et al (2020) for the muskrat, little brown bat, river otter, mink, red-winged blackbird, tree swallow, and brown pelican.
Surrogate footnotes 5, 6, 7, 8, 9, 10, 11, 12 and 14 are provided on Appendix F Table 1.

Notes:
ug/L - micrograms per liter
ESV - Ecological Screening Value
J - Analyte positively detected but value is an approximate concentration.
J+ - The chemical was positively identified; however, the associated numerical value is a high estimated concentration.
J- - The chemical was positively identified; however, the associated numerical value is a low estimated concentration.
U - Concentration is less than the laboratory reportable limit.
detected concentration exceeds the chronic ESV
detected concentration exceeds the chronic and acute ESVs
Source Footnotes -
1 - Hazardous Concentration 1% (HC1) (Conder, et al., 2020).
PFOS Hazardous Concentration 5% (HC5) is 5.85 ug/L.
2 - Recommended water quality (RWQ) risk-based screening level (RBSL)(Divine, et al., 2020).
Surrogate footnotes 5, 6, 8, 11, 12, and 14 are provided on Appendix F Table 1.

Notes:
ug/L - micrograms per liter
ESV - Ecological Screening Value
J - Analyte positively detected but value is an approximate concentration.
J+ - The chemical was positively identified; however, the associated numerical value is a high estimated concentration.
J- - The chemical was positively identified; however, the associated numerical value is a low estimated concentration.
U - Concentration is less than the laboratory reportable limit.
detected concentration exceeds the chronic ESV
detected concentration exceeds the chronic and acute ESVs
Source Footnotes -
1 - Hazardous Concentration 1% (HC1) (Conder, et al., 2020).
PFOS Hazardous Concentration 5% (HC5) is 5.85 ug/L.
2 - Recommended water quality (RWQ) risk-based screening level (RBSL)(Divine, et al., 2020).
Surrogate footnotes 5, 6, 8, 11, 12, and 14 are provided on Appendix F Table 1.

Notes:
ug/L - micrograms per liter
ESV - Ecological Screening Value
J - Analyte positively detected but value is an approximate concentration.
J+ - The chemical was positively identified; however, the associated numerical value is a high estimated concentration.
J- - The chemical was positively identified; however, the associated numerical value is a low estimated concentration.
U - Concentration is less than the laboratory reportable limit.
detected concentration exceeds the chronic ESV
detected concentration exceeds the chronic and acute ESVs
Source Footnotes -
1 - Hazardous Concentration 1% (HC1) (Conder, et al., 2020).
PFOS Hazardous Concentration 5% (HC5) is 5.85 ug/L.
2 - Recommended water quality (RWQ) risk-based screening level (RBSL)(Divine, et al., 2020).
Surrogate footnotes 5, 6, 8, 11, 12, and 14 are provided on Appendix F Table 1.

Notes:
References for all species-specific exposure factors are provided in Table 2.
1 - Dry weight food ingestion rate (FIR) is applied to concentrations of PFAS in sediment, generally reported on dry weight basis.
2 - Wet weight FIR is applied to tissue data, generally reported on fresh or wet weight basis.
3 - AUF values for receptors were calculated by dividing the size of the exposure area by the home range. If the home range is smaller than the exposure area, an AUF of 1 was used. Site Use Factor (SUF) of 1 was selected for all receptors.
4 - Dietary ingestion rates were calculated by multiplying the receptor- and tissue-specific proportion of diet by the receptor-specific FIR_{ww}.
5 - IR_S were calculated by multiplying the receptor-specific P_S by the receptor-specific FIR_{dw}.
6 - IR_W is reported in L/day or kg/day because 1 L of water has weight of 1 kg

Abbreviations:
dw - dry weight
kg - kilogram
L - liters
RC - Raleigh Creek
ww - wet weight

Exposure Areas (Acres):
RC - Upper = 21

Appendix G Food Web Model – Raleigh Creek - Upper
Table 2. Information Sources for Wildlife Exposure Parameters
Ecological Risk Assessment Food Web Model

Receptor Type	Feeding Guild	Species	Parameter	Definition	Value	Units	Reference	Notes
Bird	Herbivore	Wood Duck	BW	Body Weight	0.70	kg	NC WRC (2019)	Lowest reported body weight (converted to kg)
Bird	Herbivore	Wood Duck	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.041	kg, dw/day	Nagy (2001)	Calculated using DW allometric equation for omnivorous birds: FIR (dw) = 0.67 x BW ^ 0.627
Bird	Herbivore	Wood Duck	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.13	kg, ww/day	Nagy (2001)	Calculated using WW allometric equation for omnivorous birds: FIR (ww) = 2.094 x BW ^ 0.627
Bird	Herbivore	Wood Duck	P_{veg}	Proportion of Diet - Vegetation	0.90	kg diet item, ww/kg diet, ww	MN DNR (2020)	Consume acorns, weed seeds, berries, plants and insects; assume majority is vegetation (https://www.dnr.state.mn.us/birds/woodduck.html)
Bird	Herbivore	Wood Duck	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.05	kg diet item, ww/kg diet, ww	MN DNR (2020)	Consume acorns, weed seeds, berries, plants and insects; assume majority is vegetation (https://www.dnr.state.mn.us/birds/woodduck.html)
Bird	Herbivore	Wood Duck	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.05	kg diet item, ww/kg diet, ww	MN DNR (2020)	Consume acorns, weed seeds, berries, plants and insects; assume majority is vegetation (https://www.dnr.state.mn.us/birds/woodduck.html)
Bird	Herbivore	Wood Duck	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	MN DNR (2020)	Assumed not to be consumed based on reported diet contents.
Bird	Herbivore	Wood Duck	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww	MN DNR (2020)	Assumed not to be consumed based on reported diet contents.
Bird	Herbivore	Wood Duck	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	MN DNR (2020)	Assumed not to be consumed based on reported diet contents.
Bird	Herbivore	Wood Duck	P_{s}	Proportion of Diet - Sediment	0.24	kg sediment, dw/kg diet, dw	USEPA (1993)	Sediment ingestion in wood duck (USEPA, 1993).
Bird	Herbivore	Wood Duck	IR_{W}	Daily Water Ingestion	0.041	L water/day	USEPA (1993)	Mallard used as a surrogate; IR L/day= IR 0.058 (L/kg)*BW (kg)
Bird	Herbivore	Wood Duck	HR	Home Range	776	acres	CDFW (2021)	In Minnesota, breeding female wood ducks remained within 1 km (0.6 mi) of the nest during 70% of their time away (Gilmer et al. 1978, as cited in CDFW 2021); therefore, home range was calculated as area from nest using 1 km as radius.
Bird	Invertivore	Tree Swallow	BW	Body Weight	0.020	kg	Nagy (2001)	Measured value for tree swallow.
Bird	Invertivore	Tree Swallow	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.012	kg, dw/day	Nagy (2001)	Measured value for tree swallow (dry matter intake).
Bird	Invertivore	Tree Swallow	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.035	kg, ww/day	Nagy (2001)	Measured value for tree swallow (fresh matter intake).
Bird	Invertivore	Tree Swallow	P_{veg}	Proportion of Diet - Vegetation	0.17	kg diet item, ww/kg diet, ww	Beal (1918); USACHPPM (2004)	Estimated proportion of plant material.
Bird	Invertivore	Tree Swallow	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.26	kg diet item, ww/kg diet, ww	Beal (1918); USACHPPM (2004)	Estimated based on proportion of non-flying insects.
Bird	Invertivore	Tree Swallow	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.57	kg diet item, ww/kg diet, ww	Beal (1918); USACHPPM (2004)	Estimated based on proportion of flying (emergent aquatic) insects.
Bird	Invertivore	Tree Swallow	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	USACHPPM (2004)	Assumed not to be consumed.
Bird	Invertivore	Tree Swallow	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww	USACHPPM (2004)	Assumed not to be consumed.
Bird	Invertivore	Tree Swallow	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	USACHPPM (2004)	Assumed not to be consumed.
Bird	Invertivore	Tree Swallow	P_{s}	Proportion of Diet - Sediment	--	kg sediment, dw/kg diet, dw	Divine et al. (2020)	Assumed negligible based on feedng strategy.
Bird	Invertivore	Tree Swallow	IR_{W}	Daily Water Ingestion	0.0040	L water/day	USEPA (1993)	IR L/day= IR (L/kg)*BW (kg)
Bird	Invertivore	Tree Swallow	HR	Home Range	194	acres	Custer et al. (2019)	Tree swallows feed within approximately 0.5 km of their nest boxes (Stapleton and Robertson 2006, as cited in Custer et al. 2019); therefore, home range was calculated as area from nest using 0.5 km as radius.
Bird	Invertivore	Spotted sandpiper	BW	Body Weight	0.043	kg	USEPA (1993)	Average values reported for adult male and female spotted sandpipers (USEPA 1993).
Bird	Invertivore	Spotted sandpiper	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.0076	kg, dw/day	Nagy (2001)	Calculated using DW allometric equation for insectivore birds: FIR (dw) = 0.54 x BW ^ 0.705
Bird	Invertivore	Spotted sandpiper	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.0230	kg, ww/day	Nagy (2001)	Calculated using WW allometric equation for insectivore birds: FIR (ww) = 1.633 x BW ^ 0.705
Bird	Invertivore	Spotted sandpiper	P_{veg}	Proportion of Diet - Vegetation	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed.
Bird	Invertivore	Spotted sandpiper	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.80	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated based on USEPA (1993: Adult flying insects comprise the bulk of the diet; however, crustaceans, leeches, molluscs, small fish, and carrion also are eaten.
Bird	Invertivore	Spotted sandpiper	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.15	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated based on USEPA (1993: Adult flying insects comprise the bulk of the diet; however, crustaceans, leeches, molluscs, small fish, and carrion also are eaten.
Bird	Invertevore	Spotted sandpiper	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed based on reported diet contents.
Bird	Invertivore	Spotted sandpiper	P_{ff}	Proportion of Diet - Forage Fish	0.05	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed only to consume small fish.
Bird	Invertivore	Spotted sandpiper	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed.
Bird	Invertivore	Spotted sandpiper	P_{s}	Proportion of Diet - Sediment	0.073	kg sediment, dw/kg diet, dw	USEPA (1993)	Soil/sediment estimated in Least sandpiper diet (USEPA, 1993).
Bird	Invertivore	Spotted sandpiper	IR_{W}	Daily Water Ingestion	0.054	L water/day	USEPA (1993)	IR L/day= IR (L/kg)*BW (kg); Sandpiper used as surrogate
Bird	Invertivore	Spotted sandpiper	HR	Home Range	5.0	acres	CDFW (2021)	In New York, 3 individually marked breeding females fed and displayed over areas of 1.06,1.8, and 3.2 ha (2.5, 4.5 and 8.0 acres), with an average home range of 2.02 ha (5 acres) (Hays 1972, as cited in CDFW 2021).

Project 1007
Minneapolis, Minnesota

Receptor Type	Feeding Guild	Species	Parameter	Definition	Value	Units	Reference	Notes
Bird	Piscivore	Great Blue Heron	BW	Body Weight	2.4	kg	USEPA (1993)	
Bird	Piscivore	Great Blue Heron	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.11	kg, dw/day	USEPA (1993)	Calculated from the ww-based FIR, assuming an 75% moisture content of food (i.e., 0.25 g, dw/g, ww).
Bird	Piscivore	Great Blue Heron	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.43	kg, ww/day	USEPA (1993)	FIR kg/day= WW FIR (kg/kg-day)*BW (kg) with FIR (kg/kg-day) of 0.18 from USEPA (1993)
Bird	Piscivore	Great Blue Heron	P_{veg}	Proportion of Diet - Vegetation	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents; consult additional literature for more information.
Bird	Piscivore	Great Blue Heron	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.15	kg diet item, ww/kg diet, ww	USEPA (1993)	Fish are the preferred prey, but great blues also eat amphibians, reptiles, crustaceans, insects, birds, and Mammals
Bird	Piscivore	Great Blue Heron	P_{ai}	Proportion of Diet - Aquatic Invertebrates	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents
Bird	Piscivore	Great Blue Heron	P_{am}	Proportion of Diet - Amphibians	0.05	kg diet item, ww/kg diet, ww	USEPA (1993)	Fish are the preferred prey, but great blues also eat amphibians, reptiles, crustaceans, insects, birds, and Mammals
Bird	Piscivore	Great Blue Heron	P_{ff}	Proportion of Diet - Forage Fish	0.80	kg diet item, ww/kg diet, ww	USEPA (1993)	Fish are the preferred prey, but great blues also eat amphibians, reptiles, crustaceans, insects, birds, and mammals
Bird	Piscivore	Great Blue Heron	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents; consult additional literature for more information.
Bird	Piscivore	Great Blue Heron	P_{s}	Proportion of Diet - Sediment	0.0040	kg sediment, dw/kg diet, dw	USEPA (1993)	Assumed to be approximately 20% of the value assumed for the Mallard, which was obtained from Table 4-4 in USEPA (1993)
Bird	Piscivore	Great Blue Heron	IR_{W}	Daily Water Ingestion	0.11	L water/day	USEPA (1993)	IR L/day= IR (L/kg)*BW (kg)
Bird	Piscivore	Great Blue Heron	HR	Home Range	11	acres	USEPA (1993)	Average of Fall and Winter homeranges
Mammal	Herbivore	Muskrat	BW	Body Weight	1.6	kg	MN DNR (2020)	Average of all adult body weights in MN (https://www.dnr.state.mn.us/Mammals/muskrat.html)
Mammal	Herbivore	Muskrat	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.14	kg, dw/day	USEPA (1993)	Calculated from the ww-based FIR, assuming an 75% moisture content of food (i.e., 0.25 g, dw/g, ww).
Mammal	Herbivore	Muskrat	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.54	kg, ww/day	USEPA (1993)	FIR kg/day= WW FIR (kg/kg-day)*BW (kg) with FIR (kg/kg-day) of 0.34 from USEPA (1993)
Mammal	Herbivore	Muskrat	P_{veg}	Proportion of Diet - Vegetation	0.80	kg diet item, ww/kg diet, ww	USEPA (1993)	Primarily herbivorous.
Mammal	Herbivore	Muskrat	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.10	kg diet item, ww/kg diet, ww	USEPA (1993)	Primarily herbivorous.
Mammal	Herbivore	Muskrat	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.10	kg diet item, ww/kg diet, ww	USEPA (1993)	Primarily herbivorous.
Mammal	Herbivore	Muskrat	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Mammal	Herbivore	Muskrat	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Mammal	Herbivore	Muskrat	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Mammal	Herbivore	Muskrat	P_{s}	Proportion of Diet - Sediment	0.020	kg sediment, dw/kg diet, dw	USEPA (1993)	Meadow Vole used as a surrogate
Mammal	Herbivore	Muskrat	IR_{W}	Daily Water Ingestion	0.88	L water/day	USEPA (1993)	Max reported; IR L/day= IR (L/kg)*BW (kg)
Mammal	Herbivore	Muskrat	HR	Home Range	0.32	acres	USEPA (1993)	Average HR reported (0.13 ha) converted to acres.
Mammal	Invertivore	Little Brown Bat	BW	Body Weight	0.0085	kg	MN DNR (2020)	Average of adult little brown bats in Minnesota (https://www.dnr.state.mn.us/rsg/profile.html?action=elementDetail&selectedElement=AMACC01010)
Mammal	Invertivore	Little Brown Bat	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.0016	kg, dw/day	Nagy (2001)	Measured value for little brown bat (dry matter intake).
Mammal	Invertivore	Little Brown Bat	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.0049	kg, ww/day	Nagy (2001)	Measured value for little brown bat (fresh matter intake).
Mammal	Invertivore	Little Brown Bat	P_{veg}	Proportion of Diet - Vegetation	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on strict aerial insect diet.
Mammal	Invertivore	Little Brown Bat	P_{bi}	Proportion of Diet - Benthic Invertebrates	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on strict aerial insect diet.
Mammal	Invertivore	Little Brown Bat	P_{ai}	Proportion of Diet - Aquatic Invertebrates	1.0	kg diet item, ww/kg diet, ww	Fenton and Barclay (1980); cited in Sample et al. (1997)	Based on strict aerial insect diet, i.e., aquatic (emergent aerial) insects.
Mammal	Invertivore	Little Brown Bat	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	Sample et al. (1997)	Assumed not to be consumed based on strict aerial insect diet.
Mammal	Invertivore	Little Brown Bat	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww	Sample et al. (1997)	Assumed not to be consumed based on strict aerial insect diet.
Mammal	Invertivore	Little Brown Bat	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	Sample et al. (1997)	Assumed not to be consumed based on strict aerial insect diet.
Mammal	Invertivore	Little Brown Bat	P_{so}	Proportion of Diet - Sediment	--	kg sediment, dw/kg diet, dw	Sample et al. (1997)	Assumed negligible based on feeding strategy.
Mammal	Invertivore	Little Brown Bat	IR_{W}	Daily Water Ingestion	0.001	L water/day	USEPA (1993)	IR L/day= IR (L/kg)*BW (kg)
Mammal	Invertivore	Little Brown Bat	HR	Home Range	74	acres	Henry et al. (2002); Divine et al. (2020)	Home-range size of pregnant little brown bat on Grosse-Ile, Quebec, Canada, summers of 1999 and 2000 (Henry et al. 2002, as cited in Divine et al. 2020).

Appendix G Food Web Model – Raleigh Creek - Upper
Table 2. Information Sources for Wildlife Exposure Parameters
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Receptor Type	Feeding Guild	Species	Parameter	Definition	Value	Units	Reference	Notes
Mammal	Omnivore	Raccoon	BW	Body Weight	8.6	kg	MN DNR (2020)	Average of adult raccoon in Minnesota (https://www.dnr.state.mn.us/Mammals/raccoon.html)
Mammal	Omnivore	Raccoon	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.05	kg, dw/day	Nagy (2001)	Calculated from the ww-based FIR, assuming an 75% moisture content of food (i.e., 0.25 g, dw/g, ww).
Mammal	Omnivore	Raccoon	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.20	kg, dw/day	Nagy (2001)	Calculated using DW allometric equation for omnivorous Mammals: FIR (dw) = 0.432 x BW ^ 0.678
Mammal	Omnivore	Raccoon	P_{veg}	Proportion of Diet - Vegetation	0.45	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated from listed diet of vegetation in USEPA (1993)
Mammal	Omnivore	Raccoon	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.40	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated from listed diet of crayfish and portion of invertebrates in USEPA (1993)
Mammal	Omnivore	Raccoon	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.05	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated from portion of invertebrates diet in USEPA (1993)
Mammal	Omnivore	Raccoon	P_{am}	Proportion of Diet - Amphibians	0.05	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated from portion of amphibians diet in USEPA (1993)
Mammal	Omnivore	Raccoon	P_{ff}	Proportion of Diet - Forage Fish	0.05	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated from portion of fish and rodents diet in USEPA (1993)
Mammal	Omnivore	Raccoon	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed based on reported diet contents; consult additional literature for more information.
Mammal	Omnivore	Raccoon	P_{s}	Proportion of Diet - Sediment	0.094	kg sediment, dw/kg diet, dw	USEPA (1993)	Estimated percent soil in diet (dw)
Mammal	Omnivore	Raccoon	IR_{W}	Daily Water Ingestion	0.41	L water/day	USEPA (1993)	Max reported; IR L/day= IR (L/kg)*BW (kg); River Otter used as surrogate
Mammal	Omnivore	Raccoon	HR	Home Range	385	acres	USEPA (1993)	Based on the average home range of both sexes within Michigan riparian habitat.

Abbreviations:
dw - dry weight
kg - kilogram
L - liters
ww - wet weight

PFAS Abbreviations:
FASAA - perrfluoroalkane sulfonamido acetic acids
FASE - perfluoroalkane sulfonamido ethanols
FOSA - perfluorooctane sulfonamides
N-EtFOSAA - N-Ethylperfluorooctane sulfonamidoacetic acid
N-MeFOSAA - N-Methylperfluorooctane sulfonamidoacetic acid
PFAS - Per- and polyfluoroalkyl substances
PFBA - Perfluorobutanoic acid
PFBS - Perfluorobutanesulfonic acid
PFCA - Perfluoroalkyl carboxylic acids
PFDA - Perfluorodecanoic acid
PFDoA - Perfluorododecanoic acid
PFDoS - Perfluorododecane sulfonic acid
PFDS - Perfluorodecane sulfonic acid
PFHpA - Perfluoroheptanoic acid
PFHpS - Perfluoroheptane sulfonic acid
PFHxA - Perfluorohexanoic acid

PFAS Abbreviations Cont.:
PFHxS - Perfluorohexanesulfonic acid
PFNA - Perfluorononanoic acid
PFNS - Perfluoroonoane sulfonic acid
PFOA - Perfluorooctanoic acid
PFOS - Perfluorooctanesulfonic acid
PFOSA - Perfluorooctane sulfonamide
PFPeA - Perfluoropentanoic acid
PFPeS - Perfluoropentane sulfonic acid
PFSA- perfluoroalkane sulfonic acids
PFTeDA - Perfluorotetradecanoic acid
PFTrDA - Perfluorotridecanoic acid
PFUnA - Perfluoroundecanoic acid
5:3 FTCA - 5:3 Fluorotelomer carboxylic acid
6:2 FTS - 6:2 Fluorotelomer sulfonic acid
7:3 FTCA - 7:3 Fluorotelomer carboxylic acid

Addditional Abbreviations:
BAF - Bioaccumulation Factor
dw - dry weight
kg - kilogram
L - liter
UF - uptake factor

Notes:
a: Converted to ww tissue using 85.5% moisture content (average of algae [84%] and aquatic macrophytes [87%]; Table 4-2 EPA 1993)
b: Converted to ww tissue using 82% moisture content (bivalves (without shell); Table 4-1 EPA 1993)

c: Aquatic/Benthic Invert Values are based on filter-feeding benthic invertebrates (oyster, mussel, gastropod, snail, other bivalves) and were selected to represent aquatic invertebrates (including aerial insects) exposed to PFAS in water. Filter-feeding benthic invertebrates are expected to have exposure to contaminants in the water column similar to other aquatic invertebrate species and expected to have lower exposure to sediments.

Notes:
TRVs were selected from the following hierarchy due to preference for EcoSSL TRV-derivation approach (USEPA 2005) and that Zodrow et al. (2020) has been peer reviewed:

1. Divine et al. (2020) and/or Zodrow et al. (2020)
2. Condor et al. (2020)

Abbreviations:
See Table 3 for PFAS abbreviations
µg/kg-day - micrograms per kilogram body weight per day
EcoSSL - Ecological Soil Screening Level
LOAEL - lowest observed adverse effects level
NOAEL - no observed adverse effects level
TRV - toxicity reference value
USEPA - United States Environmental Protection Agency

Notes:
TRVs were selected from the following hierarchy due to preference for EcoSSL TRV-derivation approach (USEPA 2005) and that Zodrow et al. (2020) has been peer reviewed:

1. Divine et al. (2020) and/or Zodrow et al. (2020)
2. Condor et al. (2020)

Abbreviations:
See Table 3 for PFAS abbreviations
µg/kg-day - micrograms per kilogram body weight per day
EcoSSL - Ecological Soil Screening Level
LOAEL - lowest observed adverse effects level
NOAEL - no observed adverse effects level
TRV - toxicity reference value
USEPA - United States Environmental Protection Agency

Notes:
EPCs were selected as the lower of the selected UCL and maximum detected concentration (see Appendix D)
Site-specific empirical data were selected over modeled values when available:
Benthic invertebrates = crayfish
Amphibians = green frogs and tadpoles
Forage fish = golden shiner, fathead minnows, mudminnow, stickleback, and green sunfish
When empirical data were lacking, tissue EPCs were calculated by multiplying the surface water EPC by the analyte- and tissue-specific bioaccumulation parameter (see Table 3).

Abbreviations:
See Table 3 for PFAS abbreviations
µg - micrograms
dw - dry weight
EPC - exposure point concentration
kg - kilogram
L - liters
NC - not calculated
ND - not detected
UCL - upper confidence limit of the arithmetic mean
ww - wet weight

Appendix G Food Web Model – Raleigh Creek - Upper
Table 7. Potential Risks to the Wood Duck
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Site: Raleigh Creek - Upper	
Assumptions for the Wood Duck	
Body Weight (kg)	0.70
Seasonal Use Factor	1
Site-Specific Area Use Factor	0.027
Sediment Ingestion Rate (kg_{dw}/day)	0.0098
Water Ingestion Rate (kg/day)	0.041
Benthic Invert. Ingestion Rate (kg_{ww}/day)	0.0064
Aquatic Invert. Ingestion Rate (kg_{ww}/day)	0.0064
Plant Ingestion Rate (kg_{ww}/day)	0.11

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w]) \times SUF \times AUF}{\text{Body Weight}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment (kg/day)
IR_w = Ingestion rate of water (L/day)
C_f = Concentration of PFAS in food (ug/kg)
C_s= Concentration of PFAS in sediment (ug/kg)
C_w = Concentration of PFAS in water (ug/L)
SUF = Seasonal Use Factor (fraction of time receptor spends within exposure area)

SUPPORTING CALCULATIONS

Notes:
HQs above 1 are bolded and highlighted.

Abbreviations:

See Table 3 for PFAS abbreviations
µg - microgram
BW - body weight
dw - dry weight
EPC - exposure point concentration
HQ - hazard quotient (Dose/TRV)
kg - kilogram
L - liter
LOAEL - lowest observed adverse effects level
NC - not calculated
ND - not detected
NOAEL - no observed adverse effects level
TRV - toxicity reference value
UCL - upper confidence limit of the arithmetic mean
ww - wet weight

Appendix G Food Web Model – Raleigh Creek - Upper
Table 9. Potential Risks to the Spotted Sandpiper
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Site: Raleigh Creek - Upper	
Assumptions for the Spotted Sandpiper	
Body Weight (kg)	0.043

Notes:
HQs above 1 are bolded and highlighted.

Abbreviations:

See Table 3 for PFAS abbreviations
µg - microgram
BW - body weight
dw - dry weight
EPC - exposure point concentration
HQ - hazard quotient (Dose/TRV)
kg - kilogram
L - liter
LOAEL - lowest observed adverse effects level
NC - not calculated
ND - not detected
NOAEL - no observed adverse effects level
TRV - toxicity reference value
UCL - upper confidence limit of the arithmetic mean
ww - wet weight

Appendix G Food Web Model – Raleigh Creek - Upper
Table 11. Potential Risks to the Muskrat
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Site: Raleigh Creek - Upper	
Assumptions for the Muskrat	
Body Weight (kg)	1.6
Seasonal Use Factor	1
Site-Specific Area Use Factor	1.0
Sediment Ingestion Rate (kg_{dw}/day)	0.0027
Water Ingestion Rate (kg/day)	0.88
Benthic Invert. Ingestion Rate (kg_{ww}/day)	0.054
Aquatic Invert. Ingestion Rate (kg_{ww}/day)	0.054
Plant Ingestion Rate (kg_{ww}/day)	0.43

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w]) \times SUF \times AUF}{\text{Body Weight}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment (kg/day)
IR_w = Ingestion rate of water (L/day)
C_f = Concentration of PFAS in food (ug/kg)
C_s= Concentration of PFAS in sediment (ug/kg)
C_w = Concentration of PFAS in water (ug/L)
SUF = Seasonal Use Factor (fraction of time receptor spends within exposure area)

SUPPORTING CALCULATIONS

Analyte	Media Concentrations					Potential Daily Dose (ug/kg_{bw}/day)						NOAEL-based TRV ($\mu g/kg_{bw}$/day)	NOAEL-based HQ	LOAEL-based TRV ($\mu g/kg_{bw}$/day)	LOAEL-based HQ

Appendix G Food Web Model – Raleigh Creek - Upper
Table 13. Potential Risks to the Raccoon
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Site: Raleigh Creek - Upper	
Assumptions for the Raccoon	
Body Weight (kg)	8.6
Seasonal Use Factor	1
Site-Specific Area Use Factor	0.055
Sediment Ingestion Rate (kg_{dw}/day)	0.0047
Water Ingestion Rate (kg/day)	0.41
Benthic Invert. Ingestion Rate (kg_{ww}/day)	0.080
Aquatic Invert. Ingestion Rate (kg_{ww}/day)	0.010
Plant Ingestion Rate (kg_{ww}/day)	0.090
Amphibian Ingestion Rate (kg_{ww}/day)	0.010
Forage Fish Ingestion Rate (kg_{ww}/day)	0.010

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w]) \times SUF \times AUF}{\text{Body Weight}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment (kg/day)
IR_w = Ingestion rate of water (L/day)
C_f = Concentration of PFAS in food (ug/kg)
C_s= Concentration of PFAS in sediment (ug/kg)
C_w = Concentration of PFAS in water (ug/L)
SUF = Seasonal Use Factor (fraction of time receptor spends within exposure area)

SUPPORTING CALCULATIONS

AUF_{RC}	Area Use Factor for Raleigh Creek - Other [3]	proportion	0.0077	0.031	1.0	0.55	1.0	0.081	0.016

Notes:
References for all species-specific exposure factors are provided in Table 2.
1 - Dry weight food ingestion rate (FIR) is applied to concentrations of PFAS in sediment, generally reported on dry weight basis.
2 - Wet weight FIR is applied to tissue data, generally reported on fresh or wet weight basis.
3 - AUF values for receptors were calculated by dividing the size of the exposure area by the home range. If the home range is smaller than the exposure area, an AUF of 1 was used. Site Use Factor (SUF) of 1 was selected for all receptors.
4 - Dietary ingestion rates were calculated by multiplying the receptor- and tissue-specific proportion of diet by the receptor-specific FIR_{ww}.
5 - IR_S were calculated by multiplying the receptor-specific P_S by the receptor-specific FIR_{dw}.
6 - DWI is reported in L/day or kg/day because 1 L of water has weight of 1 kg

Abbreviations:
dw - dry weight
kg - kilogram
L - liters
RC - Raleigh Creek
ww - wet weight

Exposure Areas (Acres):
RC - Other = 6

Table 2. Information Sources for Wildlife Exposure Parameters
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Receptor Type	Feeding Guild	Species	Parameter	Definition	Value	Units	Reference	Notes
Bird	Herbivore	Wood Duck	BW	Body Weight	0.70	kg	NC WRC (2019)	Lowest reported body weight (converted to kg)
Bird	Herbivore	Wood Duck	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.041	kg, dw/day	Nagy (2001)	Calculated using DW allometric equation for omnivorous birds: FIR (dw) = 0.67 x BW ^ 0.627
Bird	Herbivore	Wood Duck	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.13	kg, ww/day	Nagy (2001)	Calculated using WW allometric equation for omnivorous birds: FIR (ww) = 2.094 x BW ^ 0.627
Bird	Herbivore	Wood Duck	P_{veg}	Proportion of Diet - Vegetation	0.90	kg diet item, ww/kg diet, ww	MN DNR (2020)	Consume acorns, weed seeds, berries, plants and insects; assume majority is vegetation (https://www.dnr.state.mn.us/birds/woodduck.html)
Bird	Herbivore	Wood Duck	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.05	kg diet item, ww/kg diet, ww	MN DNR (2020)	Consume acorns, weed seeds, berries, plants and insects; assume majority is vegetation (https://www.dnr.state.mn.us/birds/woodduck.html)
Bird	Herbivore	Wood Duck	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.05	kg diet item, ww/kg diet, ww	MN DNR (2020)	Consume acorns, weed seeds, berries, plants and insects; assume majority is vegetation (https://www.dnr.state.mn.us/birds/woodduck.html)
Bird	Herbivore	Wood Duck	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	MN DNR (2020)	Assumed not to be consumed based on reported diet contents.
Bird	Herbivore	Wood Duck	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww	MN DNR (2020)	Assumed not to be consumed based on reported diet contents.
Bird	Herbivore	Wood Duck	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	MN DNR (2020)	Assumed not to be consumed based on reported diet contents.
Bird	Herbivore	Wood Duck	P_{s}	Proportion of Diet - Sediment	0.24	kg sediment, dw/kg diet, dw	USEPA (1993)	Sediment ingestion in wood duck (USEPA, 1993).
Bird	Herbivore	Wood Duck	IR_{W}	Daily Water Ingestion	0.041	L water/day	USEPA (1993)	Mallard used as a surrogate; IR L/day= IR 0.058 (L/kg)*BW (kg)
Bird	Herbivore	Wood Duck	HR	Home Range	776	acres	CDFW (2021)	In Minnesota, breeding female wood ducks remained within 1 km (0.6 mi) of the nest during 70% of their time away (Gilmer et al. 1978, as cited in CDFW 2021); therefore, home range was calculated as area from nest using 1 km as radius.
Bird	Invertivore	Tree Swallow	BW	Body Weight	0.020	kg	Nagy (2001)	Measured value for tree swallow.
Bird	Invertivore	Tree Swallow	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.012	kg, dw/day	Nagy (2001)	Measured value for tree swallow (dry matter intake).
Bird	Invertivore	Tree Swallow	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.035	kg, ww/day	Nagy (2001)	Measured value for tree swallow (fresh matter intake).
Bird	Invertivore	Tree Swallow	P_{veg}	Proportion of Diet - Vegetation	0.17	kg diet item, ww/kg diet, ww	Beal (1918); USACHPPM (2004)	Estimated proportion of plant material.
Bird	Invertivore	Tree Swallow	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.26	kg diet item, ww/kg diet, ww	Beal (1918); USACHPPM (2004)	Estimated based on proportion of non-flying insects.
Bird	Invertivore	Tree Swallow	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.57	kg diet item, ww/kg diet, ww	Beal (1918); USACHPPM (2004)	Estimated based on proportion of flying (emergent aquatic) insects.
Bird	Invertivore	Tree Swallow	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	USACHPPM (2004)	Assumed not to be consumed.
Bird	Invertivore	Tree Swallow	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww	USACHPPM (2004)	Assumed not to be consumed.
Bird	Invertivore	Tree Swallow	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	USACHPPM (2004)	Assumed not to be consumed.
Bird	Invertivore	Tree Swallow	P_{s}	Proportion of Diet - Sediment	--	kg sediment, dw/kg diet, dw	Divine et al. (2020)	Assumed negligible based on feedng strategy.
Bird	Invertivore	Tree Swallow	IR_{W}	Daily Water Ingestion	0.0040	L water/day	USEPA (1993)	IR L/day= IR (L/kg)*BW (kg)
Bird	Invertivore	Tree Swallow	HR	Home Range	194	acres	Custer et al. (2019)	Tree swallows feed within approximately 0.5 km of their nest boxes (Stapleton and Robertson 2006, as cited in Custer et al. 2019); therefore, home range was calculated as area from nest using 0.5 km as radius.
Bird	Invertivore	Spotted sandpiper	BW	Body Weight	0.043	kg	USEPA (1993)	Average values reported for adult male and female spotted sandpipers (USEPA 1993).
Bird	Invertivore	Spotted sandpiper	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.0076	kg, dw/day	Nagy (2001)	Calculated using DW allometric equation for insectivore birds: FIR (dw) = 0.54 x BW ^ 0.705
Bird	Invertivore	Spotted sandpiper	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.0230	kg, ww/day	Nagy (2001)	Calculated using WW allometric equation for insectivore birds: FIR (ww) = 1.633 x BW ^ 0.705
Bird	Invertivore	Spotted sandpiper	P_{veg}	Proportion of Diet - Vegetation	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed.
Bird	Invertivore	Spotted sandpiper	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.80	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated based on USEPA (1993: Adult flying insects comprise the bulk of the diet; however, crustaceans, leeches, molluscs, small fish, and carrion also are eaten.
Bird	Invertivore	Spotted sandpiper	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.15	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated based on USEPA (1993: Adult flying insects comprise the bulk of the diet; however, crustaceans, leeches, molluscs, small fish, and carrion also are eaten.
Bird	Invertivore	Spotted sandpiper	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed based on reported diet contents.
Bird	Invertivore	Spotted sandpiper	P_{ff}	Proportion of Diet - Forage Fish	0.05	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed only to consume small fish.
Bird	Invertivore	Spotted sandpiper	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed.
Bird	Invertivore	Spotted sandpiper	P_{s}	Proportion of Diet - Sediment	0.073	kg sediment, dw/kg diet, dw	USEPA (1993)	Soil/sediment estimated in Least sandpiper diet (USEPA, 1993).
Bird	Invertivore	Spotted sandpiper	IR_{W}	Daily Water Ingestion	0.054	L water/day	USEPA (1993)	IR L/day= IR (L/kg)*BW (kg); Sandpiper used as surrogate

Appendix H Food Web Model – Raleigh Creek – Other
Table 2. Information Sources for Wildlife Exposure Parameters
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Receptor Type	Feeding Guild	Species	Parameter	Definition	Value	Units	Reference	Notes
Bird	Invertivore	Spotted sandpiper	HR	Home Range	5.0	acres	CDFW (2021)	In New York, 3 individually marked breeding females fed and displayed over areas of 1.06,1.8, and 3.2 ha (2.5, 4.5 and 8.0 acres), with an average home range of 2.02 ha (5 acres) (Hays 1972, as cited in CDFW 2021).
Bird	Piscivore	Great Blue Heron	BW	Body Weight	2.4	kg	USEPA (1993)	
Bird	Piscivore	Great Blue Heron	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.11	kg, dw/day	USEPA (1993)	Calculated from the ww-based FIR, assuming an 75% moisture content of food (i.e., 0.25 g, dw/g, ww).
Bird	Piscivore	Great Blue Heron	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.43	kg, ww/day	USEPA (1993)	FIR kg/day= WW FIR (kg/kg-day)*BW (kg) with FIR (kg/kg-day) of 0.18 from USEPA (1993)
Bird	Piscivore	Great Blue Heron	P_{veg}	Proportion of Diet - Vegetation	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents; consult additional literature for more information.
Bird	Piscivore	Great Blue Heron	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.15	kg diet item, ww/kg diet, ww	USEPA (1993)	Fish are the preferred prey, but great blues also eat amphibians, reptiles, crustaceans, insects, birds, and Mammals
Bird	Piscivore	Great Blue Heron	P_{ai}	Proportion of Diet - Aquatic Invertebrates	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents
Bird	Piscivore	Great Blue Heron	P_{am}	Proportion of Diet - Amphibians	0.05	kg diet item, ww/kg diet, ww	USEPA (1993)	Fish are the preferred prey, but great blues also eat amphibians, reptiles, crustaceans, insects, birds, and Mammals
Bird	Piscivore	Great Blue Heron	P_{ff}	Proportion of Diet - Forage Fish	0.80	kg diet item, ww/kg diet, ww	USEPA (1993)	Fish are the preferred prey, but great blues also eat amphibians, reptiles, crustaceans, insects, birds, and mammals
Bird	Piscivore	Great Blue Heron	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents; consult additional literature for more information.
Bird	Piscivore	Great Blue Heron	P_{s}	Proportion of Diet - Sediment	0.0040	kg sediment, dw/kg diet, dw	USEPA (1993)	Assumed to be approximately 20% of the value assumed for the Mallard, which was obtained from Table 4-4 in USEPA (1993)
Bird	Piscivore	Great Blue Heron	IR_{W}	Daily Water Ingestion	0.11	L water/day	USEPA (1993)	IR L/day= IR (L/kg)*BW (kg)
Bird	Piscivore	Great Blue Heron	HR	Home Range	11	acres	USEPA (1993)	Average of Fall and Winter homeranges
Mammal	Herbivore	Muskrat	BW	Body Weight	1.6	kg	MN DNR (2020)	Average of all adult body weights in MN (https://www.dnr.state.mn.us/Mammals/muskrat.html)
Mammal	Herbivore	Muskrat	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.14	kg, dw/day	USEPA (1993)	Calculated from the ww-based FIR, assuming an 75% moisture content of food (i.e., 0.25 g, dw/g, ww).
Mammal	Herbivore	Muskrat	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.54	kg, ww/day	USEPA (1993)	FIR kg/day= WW FIR (kg/kg-day)*BW (kg) with FIR (kg/kg-day) of 0.34 from USEPA (1993)
Mammal	Herbivore	Muskrat	P_{veg}	Proportion of Diet - Vegetation	0.80	kg diet item, ww/kg diet, ww	USEPA (1993)	Primarily herbivorous.
Mammal	Herbivore	Muskrat	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.10	kg diet item, ww/kg diet, ww	USEPA (1993)	Primarily herbivorous.
Mammal	Herbivore	Muskrat	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.10	kg diet item, ww/kg diet, ww	USEPA (1993)	Primarily herbivorous.
Mammal	Herbivore	Muskrat	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Mammal	Herbivore	Muskrat	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Mammal	Herbivore	Muskrat	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Mammal	Herbivore	Muskrat	P_{s}	Proportion of Diet - Sediment	0.020	kg sediment, dw/kg diet, dw	USEPA (1993)	Meadow Vole used as a surrogate
Mammal	Herbivore	Muskrat	IR_{W}	Daily Water Ingestion	0.88	L water/day	USEPA (1993)	Max reported; IR L/day= IR (L/kg)*BW (kg)
Mammal	Herbivore	Muskrat	HR	Home Range	0.32	acres	USEPA (1993)	Average HR reported (0.13 ha) converted to acres.
Mammal	Invertivore	Little Brown Bat	BW	Body Weight	0.0085	kg	MN DNR (2020)	Average of adult little brown bats in Minnesota (https://www.dnr.state.mn.us/rsg/profile.html?action=elementDetail&selectedElement=AMACC01010)
Mammal	Invertivore	Little Brown Bat	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.0016	kg, dw/day	Nagy (2001)	Measured value for little brown bat (dry matter intake).
Mammal	Invertivore	Little Brown Bat	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.0049	kg, ww/day	Nagy (2001)	Measured value for little brown bat (fresh matter intake).
Mammal	Invertivore	Little Brown Bat	P_{veg}	Proportion of Diet - Vegetation	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on strict aerial insect diet.
Mammal	Invertivore	Little Brown Bat	P_{bi}	Proportion of Diet - Benthic Invertebrates	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on strict aerial insect diet.
Mammal	Invertivore	Little Brown Bat	P_{ai}	Proportion of Diet - Aquatic Invertebrates	1.0	kg diet item, ww/kg diet, ww	Fenton and Barclay (1980); cited in Sample et al. (1997)	Based on strict aerial insect diet, i.e., aquatic (emergent aerial) insects.
Mammal	Invertivore	Little Brown Bat	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	Sample et al. (1997)	Assumed not to be consumed based on strict aerial insect diet.
Mammal	Invertivore	Little Brown Bat	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww	Sample et al. (1997)	Assumed not to be consumed based on strict aerial insect diet.

Fluortelomers								
6:2 FTS	12	1.7	Surrogate - PFHxS		1327	239	Surrogate - PFHxS	

PFAS Abbreviations:
FASAA - perrfluoroalkane sulfonamido acetic acids
FASE - perfluoroalkane sulfonamido ethanols
FOSA - perfluorooctane sulfonamides
N-EtFOSAA - N-Ethylperfluorooctane sulfonamidoacetic acid
PFAS - Per- and polyfluoroalkyl substances
PFBA - Perfluorobutanoic acid
PFBS - Perfluorobutanesulfonic acid
PFCA - Perfluoroalkyl carboxylic acids
PFDA - Perfluorodecanoic acid
PFDoA - Perfluorododecanoic acid
PFDoS - Perfluorododecane sulfonic acid
PFDS - Perfluorodecane sulfonic acid
PFHpA - Perfluoroheptanoic acid
PFHpS - Perfluoroheptane sulfonic acid

PFAS Abbreviations Cont.:
PFHxA - Perfluorohexanoic acid
6:2 FTS - 6:2 Fluorotelomer sulfonic acid
PFHxS - Perfluorohexanesulfonic acid
PFNA - Perfluorononanoic acid
PFNS - Perfluoroonoane sulfonic acid
PFOA - Perfluorooctanoic acid
PFOS - Perfluorooctanesulfonic acid
PFOSA - Perfluorooctane sulfonamide
PFPeS - Perfluoropentane sulfonic acid
PFSA- perfluoroalkane sulfonic acids
PFTeDA - Perfluorotetradecanoic acid
PFTrDA - Perfluorotridecanoic acid
PFUnA - Perfluoroundecanoic acid

Addditional Abbreviations:
BAF - Bioaccumulation Factor
dw - dry weight
kg - kilogram
L - liter
ww - wet weight

Notes:
a: Converted to ww tissue using 85.5% moisture content (average of algae [84%] and aquatic macrophytes [87%]; Table 4-2 EPA 1993)
b: Converted to ww tissue using 82% moisture content (bivalves (without shell); Table 4-1 EPA 1993)
c: Aquatic/Benthic Invert Values are based on filter-feeding benthic invertebrates (oyster, mussel, gastropod, snail, other bivalves) and were selected to represent aquatic invertebrates (including aerial insects) exposed to PFAS in water. Filter-feeding benthic invertebrates are expected to have exposure to

Notes:
TRVs were selected from the following hierarchy due to preference for EcoSSL TRV-derivation approach (USEPA 2005) and that Zodrow et al. (2020) has been peer reviewed:

1. Divine et al. (2020) and/or Zodrow et al. (2020)
2. Condor et al. (2020)

Abbreviations:
See Table 3 for PFAS abbreviations
µg/kg-day - micrograms per kilogram body weight per day
EcoSSL - Ecological Soil Screening Level
LOAEL - lowest observed adverse effects level
NOAEL - no observed adverse effects level
TRV - toxicity reference value
USEPA - United States Environmental Protection Agency

Notes:
EPCs were selected as the lower of the selected UCL and maximum detected concentration (see Appendix D)
Site-specific empirical data were selected over modeled values when available:
Benthic invertebrates = crayfish
Amphibians = green frogs and tadpoles
Forage fish = mudminnow, green sunfish, darter, and red ear sunfish
When empirical data were lacking, tissue EPCs were calculated by multiplying the surface water EPC by the analyte- and tissue-specific bioaccumulation parameter (see Table 3).

Additional Abbreviations:
See Table 3 for PFAS abbreviations
µg - micrograms
UCL - upper confidence limit of the arithmetic mean
dw - dry weight
EPC - exposure point concentration
kg - kilogram
L - liters
ww - wet weight

Notes:
HQs above 1 are bolded and highlighted.

Abbreviations:
See Table 3 for PFAS abbreviations
µg - microgram
UCL - upper confidence limit of the arithmetic mean
BW - body weight
dw - dry weight
EPC - exposure point concentration
HQ - hazard quotient (Dose/TRV)
kg - kilogram
L - liter
LOAEL - lowest observed adverse effects level
NC - not calculated
ND - not detected
NOAEL - no observed adverse effects level
TRV - toxicity reference value
ww - wet weight

Notes:
HQs above 1 are bolded and highlighted.

Abbreviations:
See Table 3 for PFAS abbreviations
µg - microgram
UCL - upper confidence limit of the arithmetic mean
BW - body weight
dw - dry weight
EPC - exposure point concentration
HQ - hazard quotient (Dose/TRV)
kg - kilogram
L - liter
LOAEL - lowest observed adverse effects level
NC - not calculated
ND - not detected
NOAEL - no observed adverse effects level
TRV - toxicity reference value
ww - wet weight

Appendix H Food Web Model – Raleigh Creek – Other
Table 13. Potential Risks to the Raccoon
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Site: Raleigh Creek - Other	
Assumptions for the Raccoon	
Body Weight (kg)	8.6
Seasonal Use Factor	1
Site-Specific Area Use Factor	0.016
Sediment Ingestion Rate (kg_{dw}/day)	0.0047
Water Ingestion Rate (kg/day)	0.41
Benthic Invert. Ingestion Rate (kg_{ww}/day)	0.080
Aquatic Invert. Ingestion Rate (kg_{ww}/day)	0.010
Plant Ingestion Rate (kg_{ww}/day)	0.090
Amphibian Ingestion Rate (kg_{ww}/day)	0.010
Forage Fish Ingestion Rate (kg_{ww}/day)	0.010

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w]) \times SUF \times AUF}{\text{Body Weight}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment (kg/day)
IR_w = Ingestion rate of water (L/day)
C_f = Concentration of PFAS in food (ug/kg)
C_s = Concentration of PFAS in sediment (ug/kg)
C_w = Concentration of PFAS in water (ug/L)
SUF = Seasonal Use Factor (fraction of time receptor spends within exposure area)

SUPPORTING CALCULATIONS

Analyte	Media Concentrations							Potential Daily Dose (ug/kg_{bw}/day)								NOAEL-based TRV ($\mu g/kg_{bw}$/day)	NOAEL-based HQ	LOAEL-based TRV ($\mu g/kg_{bw}$/day)	LOAEL-based HQ

AUF_{EPL}	Area Use Factor for Eagle Point Lake [3]	proportion	0.21	0.82	1.0	1.0	0.034	1.0	1.0	1.0	0.056

Notes:
References for all species-specific exposure factors are provided in Table 2.
1 - Dry weight food ingestion rate (FIR) is applied to concentrations of PFAS in sediment, generally reported on dry weight basis.
2 - Wet weight FIR is applied to tissue data, generally reported on fresh or wet weight basis.
3 - AUF values for receptors were calculated by dividing the size of the exposure area by the home range. If the home range is smaller than the exposure area, an AUF of 1 was used. Site Use Factor (SUF) of 1 was selected for all receptors.
4 - Dietary ingestion rates were calculated by multiplying the receptor- and tissue-specific proportion of diet by the receptor-specific FIR_{ww}.
5 - IR_S were calculated by multiplying the receptor-specific P_S by the receptor-specific FIR_{dw}.
6 - IR_W is reported in L/day or kg/day because 1 L of water has weight of 1 kg

Abbreviations:
dw - dry weight
EPL - Eagle Point Lake
kg - kilogram
L - liters
ww - wet weight

Exposure Areas (Acres):
EPL = 160

Receptor Type	Feeding Guild	Species	Parameter	Definition	Value	Units	Reference	Notes
Bird	Herbivore	Wood Duck	BW	Body Weight	0.70	kg	NC WRC (2019)	Lowest reported body weight (converted to kg)
Bird	Herbivore	Wood Duck	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.041	kg, dw/day	Nagy (2001)	Calculated using DW allometric equation for omnivorous birds: FIR (dw) = 0.67 x BW ^ 0.627
Bird	Herbivore	Wood Duck	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.13	kg, ww/day	Nagy (2001)	Calculated using WW allometric equation for omnivorous birds: FIR (ww) = 2.094 x BW ^ 0.627
Bird	Herbivore	Wood Duck	P_{veg}	Proportion of Diet - Vegetation	0.90	kg diet item, ww/kg diet, ww	MN DNR (2020)	Consume acorns, weed seeds, berries, plants and insects; assume majority is vegetation (https://www.dnr.state.mn.us/birds/woodduck.html)
Bird	Herbivore	Wood Duck	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.05	kg diet item, ww/kg diet, ww	MN DNR (2020)	Consume acorns, weed seeds, berries, plants and insects; assume majority is vegetation (https://www.dnr.state.mn.us/birds/woodduck.html)
Bird	Herbivore	Wood Duck	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.05	kg diet item, ww/kg diet, ww	MN DNR (2020)	Consume acorns, weed seeds, berries, plants and insects; assume majority is vegetation (https://www.dnr.state.mn.us/birds/woodduck.html)
Bird	Herbivore	Wood Duck	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	MN DNR (2020)	Assumed not to be consumed based on reported diet contents.
Bird	Herbivore	Wood Duck	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww	MN DNR (2020)	Assumed not to be consumed based on reported diet contents.
Bird	Herbivore	Wood Duck	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	MN DNR (2020)	Assumed not to be consumed based on reported diet contents.
Bird	Herbivore	Wood Duck	P_{s}	Proportion of Diet - Sediment	0.24	kg sediment, dw/kg diet, dw	USEPA (1993)	Sediment ingestion in wood duck (USEPA, 1993).
Bird	Herbivore	Wood Duck	IR_{W}	Daily Water Ingestion	0.041	L water/day	USEPA (1993)	Mallard used as a surrogate; IR L/day= IR 0.058 (L/kg)*BW (kg)
Bird	Herbivore	Wood Duck	HR	Home Range	776	acres	CDFW (2021)	In Minnesota, breeding female wood ducks remained within 1 km (0.6 mi) of the nest during 70% of their time away (Gilmer et al. 1978, as cited in CDFW 2021); therefore, home range was calculated as area from nest using 1 km as radius.
Bird	Invertivore	Tree Swallow	BW	Body Weight	0.020	kg	Nagy (2001)	Measured value for tree swallow.
Bird	Invertivore	Tree Swallow	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.012	kg, dw/day	Nagy (2001)	Measured value for tree swallow (dry matter intake).
Bird	Invertivore	Tree Swallow	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.035	kg, ww/day	Nagy (2001)	Measured value for tree swallow (fresh matter intake).
Bird	Invertivore	Tree Swallow	P_{veg}	Proportion of Diet - Vegetation	0.17	kg diet item, ww/kg diet, ww	Beal (1918); USACHPPM (2004)	Estimated proportion of plant material.
Bird	Invertivore	Tree Swallow	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.26	kg diet item, ww/kg diet, ww	Beal (1918); USACHPPM (2004)	Estimated based on proportion of non-flying insects.
Bird	Invertivore	Tree Swallow	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.57	kg diet item, ww/kg diet, ww	Beal (1918); USACHPPM (2004)	Estimated based on proportion of flying (emergent aquatic) insects.
Bird	Invertivore	Tree Swallow	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	USACHPPM (2004)	Assumed not to be consumed.
Bird	Invertivore	Tree Swallow	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww	USACHPPM (2004)	Assumed not to be consumed.
Bird	Invertivore	Tree Swallow	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	USACHPPM (2004)	Assumed not to be consumed.
Bird	Invertivore	Tree Swallow	P_{s}	Proportion of Diet - Sediment	--	kg sediment, dw/kg diet, dw	Divine et al. (2020)	Assumed negligible based on feedng strategy.
Bird	Invertivore	Tree Swallow	IR_{W}	Daily Water Ingestion	0.0040	L water/day	USEPA (1993)	IR L/day= IR (L/kg)*BW (kg)
Bird	Invertivore	Tree Swallow	HR	Home Range	194	acres	Custer et al. (2019)	Tree swallows feed within approximately 0.5 km of their nest boxes (Stapleton and Robertson 2006, as cited in Custer et al. 2019); therefore, home range was calculated as area from nest using 0.5 km as radius.
Bird	Invertivore	Spotted sandpiper	BW	Body Weight	0.043	kg	USEPA (1993)	Average values reported for adult male and female spotted sandpipers (USEPA 1993).
Bird	Invertivore	Spotted sandpiper	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.0076	kg, dw/day	Nagy (2001)	Calculated using DW allometric equation for insectivore birds: FIR (dw) = 0.54 x BW ^ 0.705
Bird	Invertivore	Spotted sandpiper	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.0230	kg, ww/day	Nagy (2001)	Calculated using WW allometric equation for insectivore birds: FIR (ww) = 1.633 x BW ^ 0.705
Bird	Invertivore	Spotted sandpiper	P_{veg}	Proportion of Diet - Vegetation	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed.
Bird	Invertivore	Spotted sandpiper	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.80	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated based on USEPA (1993: Adult flying insects comprise the bulk of the diet; however, crustaceans, leeches, molluscs, small fish, and carrion also are eaten.
Bird	Invertivore	Spotted sandpiper	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.15	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated based on USEPA (1993: Adult flying insects comprise the bulk of the diet; however, crustaceans, leeches, molluscs, small fish, and carrion also are eaten.
Bird	Invertivore	Spotted sandpiper	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed based on reported diet contents.
Bird	Invertivore	Spotted sandpiper	P_{ff}	Proportion of Diet - Forage Fish	0.05	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed only to consume small fish.
Bird	Invertivore	Spotted sandpiper	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed.
Bird	Invertivore	Spotted sandpiper	P_{s}	Proportion of Diet - Sediment	0.073	kg sediment, dw/kg diet, dw	USEPA (1993)	Soil/sediment estimated in Least sandpiper diet (USEPA, 1993).
Bird	Invertivore	Spotted sandpiper	IR_{W}	Daily Water Ingestion	0.054	L water/day	USEPA (1993)	IR L/day= IR (L/kg)*BW (kg); Sandpiper used as surrogate
Bird	Invertivore	Spotted sandpiper	HR	Home Range	5.0	acres	CDFW (2021)	In New York, 3 individually marked breeding females fed and displayed over areas of 1.06,1.8, and 3.2 ha (2.5, 4.5 and 8.0 acres), with an average home range of 2.02 ha (5 acres) (Hays 1972, as cited in CDFW 2021).

Receptor Type	Feeding Guild	Species	Parameter	Definition	Value	Units	Reference	Notes
Bird	Piscivore	Great Blue Heron	BW	Body Weight	2.4	kg	USEPA (1993)	
Bird	Piscivore	Great Blue Heron	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.11	kg, dw/day	USEPA (1993)	Calculated from the ww-based FIR, assuming an 75% moisture content of food (i.e., 0.25 g, dw/g, ww).
Bird	Piscivore	Great Blue Heron	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.43	kg, ww/day	USEPA (1993)	FIR kg/day= WW FIR (kg/kg-day)*BW (kg) with FIR (kg/kg-day) of 0.18 from USEPA (1993)
Bird	Piscivore	Great Blue Heron	P_{veg}	Proportion of Diet - Vegetation	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents; consult additional literature for more information.
Bird	Piscivore	Great Blue Heron	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.15	kg diet item, ww/kg diet, ww	USEPA (1993)	Fish are the preferred prey, but great blues also eat amphibians, reptiles, crustaceans, insects, birds, and Mammals
Bird	Piscivore	Great Blue Heron	P_{ai}	Proportion of Diet - Aquatic Invertebrates	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents
Bird	Piscivore	Great Blue Heron	P_{am}	Proportion of Diet - Amphibians	0.05	kg diet item, ww/kg diet, ww	USEPA (1993)	Fish are the preferred prey, but great blues also eat amphibians, reptiles, crustaceans, insects, birds, and Mammals
Bird	Piscivore	Great Blue Heron	P_{ff}	Proportion of Diet - Forage Fish	0.80	kg diet item, ww/kg diet, ww	USEPA (1993)	Fish are the preferred prey, but great blues also eat amphibians, reptiles, crustaceans, insects, birds, and mammals
Bird	Piscivore	Great Blue Heron	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents; consult additional literature for more information.
Bird	Piscivore	Great Blue Heron	P_{s}	Proportion of Diet - Sediment	0.0040	kg sediment, dw/kg diet, dw	USEPA (1993)	Assumed to be approximately 20% of the value assumed for the Mallard, which was obtained from Table 4-4 in USEPA (1993)
Bird	Piscivore	Great Blue Heron	IR_{W}	Daily Water Ingestion	0.11	L water/day	USEPA (1993)	IR L/day= IR (L/kg)*BW (kg)
Bird	Piscivore	Great Blue Heron	HR	Home Range	11	acres	USEPA (1993)	Average of Fall and Winter homeranges
Bird	Piscivore	Bald Eagle	BW	Body Weight	4.15	kg	USEPA (1993)	Average of adult male and female bald eagles from Alaska and Florida.
Bird	Piscivore	Bald Eagle	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.12	kg, dw/day	USEPA (1993)	Calculated from the ww-based FIR, assuming an 75% moisture content of food (i.e., 0.25 g, dw/g, ww).
Bird	Piscivore	Bald Eagle	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.50	kg, ww/day	USEPA (1993)	FIR kg/day= WW FIR (kg/kg-day)*BW (kg) with FIR (kg/kg-day) of 0.12 (free-flying in Washington and Connecticut) from USEPA (1993)
Bird	Piscivore	Bald Eagle	P_{veg}	Proportion of Diet - Vegetation	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Bird	Piscivore	Bald Eagle	P_{bi}	Proportion of Diet - Benthic Invertebrates	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Bird	Piscivore	Bald Eagle	P_{ai}	Proportion of Diet - Aquatic Invertebrates	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Bird	Piscivore	Bald Eagle	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed based on reported diet contents.
Bird	Piscivore	Bald Eagle	P_{ff}	Proportion of Diet - Forage Fish	0.45	kg diet item, ww/kg diet, ww	USEPA (1993)	Based on forage fish (bullhead, sucker) percent occurance in pellets from Maine Inland River Habitat.
Bird	Piscivore	Bald Eagle	P_{pf}	Proportion of Diet - Predatory Fish	0.55	kg diet item, ww/kg diet, ww	USEPA (1993)	Based on predatory fish (pickerel, bass, perch) and 'other fish' percent occurance in pellets from Maine Inland River Habitat, as well as conservatively assuming the percetn occurances from birds and mammals.
Bird	Piscivore	Bald Eagle	P_{s}	Proportion of Diet - Sediment	--	kg sediment, dw/kg diet, dw		Assumed negligible based on feedng strategy.
Bird	Piscivore	Bald Eagle	IR_{W}	Daily Water Ingestion	0.15	L water/day	USEPA (1993)	IR L/day= IR 0.036 (L/kg)*BW (kg)
Bird	Piscivore	Bald Eagle	HR	Home Range	4646	acres	USEPA (1993)	Mean Winter home range of adults (both sexes) in Missouri lake habitat.
Mammal	Herbivore	Muskrat	BW	Body Weight	1.6	kg	MN DNR (2020)	Average of all adult body weights in MN (https://www.dnr.state.mn.us/Mammals/muskrat.html)
Mammal	Herbivore	Muskrat	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.14	kg, dw/day	USEPA (1993)	Calculated from the ww-based FIR, assuming an 75% moisture content of food (i.e., 0.25 g, dw/g, ww).
Mammal	Herbivore	Muskrat	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.54	kg, ww/day	USEPA (1993)	FIR kg/day= WW FIR (kg/kg-day)*BW (kg) with FIR (kg/kg-day) of 0.34 from USEPA (1993)
Mammal	Herbivore	Muskrat	P_{veg}	Proportion of Diet - Vegetation	0.80	kg diet item, ww/kg diet, ww	USEPA (1993)	Primarily herbivorous.
Mammal	Herbivore	Muskrat	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.10	kg diet item, ww/kg diet, ww	USEPA (1993)	Primarily herbivorous.
Mammal	Herbivore	Muskrat	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.10	kg diet item, ww/kg diet, ww	USEPA (1993)	Primarily herbivorous.
Mammal	Herbivore	Muskrat	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Mammal	Herbivore	Muskrat	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Mammal	Herbivore	Muskrat	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Mammal	Herbivore	Muskrat	P_{s}	Proportion of Diet - Sediment	0.020	kg sediment, dw/kg diet, dw	USEPA (1993)	Meadow Vole used as a surrogate
Mammal	Herbivore	Muskrat	IR_{W}	Daily Water Ingestion	0.88	L water/day	USEPA (1993)	Max reported; IR L/day= IR (L/kg)*BW (kg)
Mammal	Herbivore	Muskrat	HR	Home Range	0.32	acres	USEPA (1993)	Average HR reported (0.13 ha) converted to acres.

Table 2. Information Sources for Wildlife Exposure Parameters
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Receptor Type	Feeding Guild	Species	Parameter	Definition	Value	Units	Reference	Notes
Mammal	Piscivore	River Otter	BW	Body Weight	7.7	kg	MN DNR (2020)	Average of adult body weights in MN (https://www.dnr.state.mn.us/mammals/riverotter.html)
Mammal	Piscivore	River Otter	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.28	kg, dw/day	Nagy (2001)	Calculated using DW allometric equation for carnivorous Mammals: FIR (dw) = 0.153 x BW ^ 0.834
Mammal	Piscivore	River Otter	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.78	kg, ww/day	Nagy (2001)	Calculated using WW allometric equation for carnivorous Mammals: FIR (ww) = 0.348 x BW ^ 0.859
Mammal	Piscivore	River Otter	P_{veg}	Proportion of Diet - Vegetation	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents
Mammal	Piscivore	River Otter	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.15	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated from listed diet items; but higher percent in streams and lake habitats
Mammal	Piscivore	River Otter	P_{ai}	Proportion of Diet - Aquatic Invertebrates	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents
Mammal	Piscivore	River Otter	P_{am}	Proportion of Diet - Amphibians	0.05	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated from listed diet items reported as amphibians, frogs, salamander, reptiles, and snake
Mammal	Piscivore	River Otter	P_{ff}	Proportion of Diet - Forage Fish	0.35	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated from listed diet items based on fish species (rather than size)
Mammal	Piscivore	River Otter	P_{pf}	Proportion of Diet - Predatory Fish	0.45	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated from listed diet items based on fish species (rather than size)
Mammal	Piscivore	River Otter	P_{s}	Proportion of Diet - Sediment	--	kg sediment, dw/kg diet, dw		Based on feeding habits assumed to not eat any sediment
Mammal	Piscivore	River Otter	IR_{W}	Daily Water Ingestion	0.41	L water/day	USEPA (1993)	Max reported; IR L/day= IR (L/kg)*BW (kg); River Otter used as surrogate
Mammal	Piscivore	River Otter	HR	Home Range	2842	acres	USEPA (1993)	Based on the average home range of Missouri marsh and streams.

Abbreviations:
dw - dry weight
kg - kilogram
L - liters
ww - wet weight

Fluortelomers									
6:2 FTS	12	1.7	Surrogate - PFHxS		1327	239	Surrogate - PFHxS		131

PFAS Abbreviations:
FASAA - perrfluoroalkane sulfonamido acetic acids
FASE - perfluoroalkane sulfonamido ethanols
FOSA - perfluorooctane sulfonamides
N-EtFOSAA - N-Ethylperfluorooctane sulfonamidoacetic acid
N-MeFOSAA - N-Methylperfluorooctane sulfonamidoacetic acid
PFAS - Per- and polyfluoroalkyl substances
PFBA - Perfluorobutanoic acid
PFBS - Perfluorobutanesulfonic acid
PFCA - Perfluoroalkyl carboxylic acids
PFDA - Perfluorodecanoic acid
PFDoA - Perfluorododecanoic acid
PFDS - Perfluorodecane sulfonic acid
PFHpA - Perfluoroheptanoic acid
PFHpS - Perfluoroheptane sulfonic acid

PFAS Abbreviations Cont.:
6:2 FTS - 6:2 Fluorotelomer sulfonic acid
PFHxA - Perfluorohexanoic acid
PFHxS - Perfluorohexanesulfonic acid
PFNA - Perfluorononanoic acid
PFNS - Perfluoroonoane sulfonic acid
PFOA - Perfluorooctanoic acid
PFOS - Perfluorooctanesulfonic acid
PFOSA - Perfluorooctane sulfonamide
PFPeA - Perfluoropentanoic acid
PFPeS - Perfluoropentane sulfonic acid
PFSA- Perfluoroalkane sulfonic acids
PFTeDA - Perfluorotetradecanoic acid
PFTrDA - Perfluorotridecanoic acid
PFUnA - Perfluoroundecanoic acid

Addditional Abbreviations:
BAF - Bioaccumulation Factor
dw - dry weight
kg - kilogram
L - liter
NC - not calculated
ww - wet weight

Notes:
a: Converted to ww tissue using 85.5% moisture content (average of algae [84%] and aquatic macrophytes [87%]; Table 4-2 EPA 1993)
b: Converted to ww tissue using 82% moisture content (bivalves (without shell); Table 4-1 EPA 1993)
c: Aquatic/Benthic Invert Values are based on filter-feeding benthic invertebrates (oyster, mussel, gastropod, snail, other bivalves) and were selected to represent aquatic invertebrates (including aerial insects) exposed to PFAS in water. Filter-feeding benthic invertebrates are expected to have exposure to contaminants in the water column similar to other aquatic invertebrate species
d: See Appendix E for BAFs derived using Project 1007 tissue and surface water data.

Notes:
EPCs were selected as the lower of the selected UCL and maximum detected concentration (see Appendix D)
Site-specific empirical data were selected over modeled values when available:
Benthic invertebrates = crayfish
Amphibians = only one green frog was collected from this area so amphibian concentrations were estimated from surface water
Forage fish = mudminnow, green sunfish, crappie, and bluegill
Predatory fish = largemouth bass
When empirical data were lacking, tissue EPCs were calculated by multiplying the surface water EPC by the analyte- and tissue-specific bioaccumulation parameter (see Table 3).

Additional Abbreviations:
See Table 3 for PFAS abbreviations
µg - micrograms
UCL - upper confidence limit of the arithmetic mean
dw - dry weight
EPC - exposure point concentration
kg - kilogram
L - liters
ww - wet weight

Appendix I Food Web Model – Eagle Point Lake
Table 7. Potential Risks to the Wood Duck
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Site: Eagle Point Lake	
Assumptions for the Wood Duck	
Body Weight (kg)	0.70
Seasonal Use Factor	1
Site-Specific Area Use Factor	0.21
Sediment Ingestion Rate (kg_{dw}/day)	0.0098
Water Ingestion Rate (kg/day)	0.041
Benthic Invert. Ingestion Rate (kg_{ww}/day)	0.0064
Aquatic Invert. Ingestion Rate (kg_{ww}/day)	0.0064
Plant Ingestion Rate (kg_{ww}/day)	0.11

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w]) \times SUF \times AUF}{\text{Body Weight}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment (kg/day)
IR_w = Ingestion rate of water (L/day)
C_f = Concentration of PFAS in food (ug/kg)
C_s= Concentration of PFAS in sediment (ug/kg)
C_w = Concentration of PFAS in water (ug/L)
SUF = Seasonal Use Factor (fraction of time receptor spends within exposure area)

SUPPORTING CALCULATIONS

Notes:
HQs above 1 are bolded and highlighted.

Abbreviations:

See Table 3 for PFAS abbreviations
µg - microgram
BW - body weight
dw - dry weight
EPC - exposure point concentration
HQ - hazard quotient (Dose/TRV)
kg - kilogram
L - liter
LOAEL - lowest observed adverse effects level
NC - not calculated
ND - not detected
NOAEL - no observed adverse effects level
TRV - toxicity reference value
UCL - upper confidence limit of the arithmetic mean
ww - wet weight

Appendix I Food Web Model – Eagle Point Lake
Table 8. Potential Risks to the Tree Swallow
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Site: Eagle Point Lake

Abbreviations:
See Table 3 for PFAS abbreviations
µg - microgram
BW - body weight
dw - dry weight
EPC - exposure point concentration
HQ - hazard quotient (Dose/TRV)
kg - kilogram
L - liter
LOAEL - lowest observed adverse effects level
NC - not calculated
ND - not detected
NOAEL - no observed adverse effects level
TRV - toxicity reference value
UCL - upper confidence limit of the arithmetic mean
ww - wet weight

Appendix I Food Web Model – Eagle Point Lake
Table 9. Potential Risks to the Spotted Sandpiper
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Site: Eagle Point Lake	
Assumptions for the Spotted Sandpiper	
Body Weight (kg)	0.043
Seasonal Use Factor	1
Site-Specific Area Use Factor	1
Sediment Ingestion Rate (kg_{dw}/day)	0.00055
Water Ingestion Rate (kg/day)	0.054
Benthic Invert. Ingestion Rate (kg_{ww}/day)	0.0184
Aquatic Invert. Ingestion Rate (kg_{ww}/day)	0.0034
Forage Fish Ingestion Rate (kg_{ww}/day)	0.0011

Total Daily Dose = $\frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w]) \times SUF \times AUF}{\text{Body Weight}}$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment (kg/day)
IR_w = Ingestion rate of water (L/day)
C_f = Concentration of PFAS in food (ug/kg)
C_s= Concentration of PFAS in sediment (ug/kg)
C_w = Concentration of PFAS in water (ug/L)
SUF = Seasonal Use Factor (fraction of time receptor spends within exposure area)

SUPPORTING CALCULATIONS

Abbreviations:
See Table 3 for PFAS abbreviations
µg - microgram
BW - body weight
dw - dry weight
EPC - exposure point concentration
HQ - hazard quotient (Dose/TRV)
kg - kilogram
L - liter
LOAEL - lowest observed adverse effects level
NC - not calculated
ND - not detected
NOAEL - no observed adverse effects level
TRV - toxicity reference value
UCL - upper confidence limit of the arithmetic mean
ww - wet weight

Appendix I Food Web Model – Eagle Point Lake
Table 12. Potential Risks to the Muskrat
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Site: Eagle Point Lake	
Assumptions for the Muskrat	
Body Weight (kg)	1.6
Seasonal Use Factor	1
Site-Specific Area Use Factor	1.0
Sediment Ingestion Rate (kg_{dw}/day)	0.0027
Water Ingestion Rate (kg/day)	0.88
Benthic Invert. Ingestion Rate (kg_{ww}/day)	0.054
Aquatic Invert. Ingestion Rate (kg_{ww}/day)	0.054
Plant Ingestion Rate (kg_{ww}/day)	0.43

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w]) \times SUF \times AUF}{\text{Body Weight}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment (kg/day)
IR_w = Ingestion rate of water (L/day)
C_f = Concentration of PFAS in food (ug/kg)
C_s= Concentration of PFAS in sediment (ug/kg)
C_w = Concentration of PFAS in water (ug/L)
SUF = Seasonal Use Factor (fraction of time receptor spends within exposure area)

Notes:
HQs above 1 are bolded and highlighted.

Abbreviations:

See Table 3 for PFAS abbreviations	LOAEL - lowest observed adverse effects level
µg - microgram	NC - not calculated
BW - body weight	ND - not detected
dw - dry weight	NOAEL - no observed adverse effects level
EPC - exposure point concentration	TRV - toxicity reference value
HQ - hazard quotient (Dose/TRV)	UCL - upper confidence limit of the arithmetic mean
kg - kilogram	ww - wet weight
L - liter	

Appendix I Food Web Model – Eagle Point Lake
Table 15. Potential Risks to the River Otter
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Site: Eagle Point Lake	
Assumptions for the River Otter	
Body Weight (kg)	7.7
Seasonal Use Factor	1
Site-Specific Area Use Factor	0.056
Water Ingestion Rate (kg/day)	0.41
Benthic Invert. Ingestion Rate (kg_{ww}/day)	0.12
Amphibian Ingestion Rate (kg_{ww}/day)	0.039
Forage Fish Ingestion Rate (kg_{ww}/day)	0.27
Predatory Fish Ingestion Rate (kg_{ww}/day)	0.35

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_w \times C_w]) \times SUF \times AUF}{\text{Body Weight}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_w = Ingestion rate of water (L/day)
C_f = Concentration of PFAS in food (ug/kg)
C_w = Concentration of PFAS in water (ug/L)
SUF = Seasonal Use Factor (fraction of time receptor spends within exposure area)

SUPPORTING CALCULATIONS

Analyte	Media Concentrations					Potential Daily Dose (ug/kg_{bw}/day)						NOAEL-based TRV ($\mu g/kg_{bw}$/day)	NOAEL-based HQ	LOAEL-based TRV ($\mu g/kg_{bw}$/day)	LOAEL-based HQ
	Benthic Invertebrate EPC (µg/kg, ww)	Amphibian EPC (µg/kg, ww)	Forage Fish EPC (µg/kg, ww)	Predatory Fish EPC (µg/kg, ww)	Surface Water EPC (µg/L)	Benthic Invertebrate	Amphibian	Forage Fish	Predatory Fish	Surface Water	Total

AUF_{LE}	Area Use Factor for Lake Elmo [3]	proportion	0.37	1.0	1.0	1.0	0.061	1.0	1.0	1.0	0.10

Notes:
References for all species-specific exposure factors are provided in Table 2.
1 - Dry weight food ingestion rate (FIR) is applied to concentrations of PFAS in sediment, generally reported on dry weight basis.
2 - Wet weight FIR is applied to tissue data, generally reported on fresh or wet weight basis.
3 - AUF values for receptors were calculated by dividing the size of the exposure area by the home range. If the home range is smaller than the exposure area, an AUF of 1 was used. Site Use Factor (SUF) of 1 was selected for all receptors.
4 - Dietary ingestion rates were calculated by multiplying the receptor- and tissue-specific proportion of diet by the receptor-specific FIR_{ww}.
5 - IR_S were calculated by multiplying the receptor-specific P_S by the receptor-specific FIR_{dw}.
6 - IR_W is reported in L/day or kg/day because 1 L of water has weight of 1 kg

Abbreviations:
dw - dry weight
kg - kilogram
L - liters
LE - Lake Elmo
ww - wet weight

Exposure Areas (Acres):
LE = 284

Receptor Type	Feeding Guild	Species	Parameter	Definition	Value	Units	Reference	Notes
Bird	Herbivore	Wood Duck	BW	Body Weight	0.70	kg	NC WRC (2019)	Lowest reported body weight (converted to kg)
Bird	Herbivore	Wood Duck	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.041	kg, dw/day	Nagy (2001)	Calculated using DW allometric equation for omnivorous birds: FIR (dw) = 0.67 x BW ^ 0.627
Bird	Herbivore	Wood Duck	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.13	kg, ww/day	Nagy (2001)	Calculated using WW allometric equation for omnivorous birds: FIR (ww) = 2.094 x BW ^ 0.627
Bird	Herbivore	Wood Duck	P_{veg}	Proportion of Diet - Vegetation	0.90	kg diet item, ww/kg diet, ww	MN DNR (2020)	Consume acorns, weed seeds, berries, plants and insects; assume majority is vegetation (https://www.dnr.state.mn.us/birds/woodduck.html)
Bird	Herbivore	Wood Duck	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.05	kg diet item, ww/kg diet, ww	MN DNR (2020)	Consume acorns, weed seeds, berries, plants and insects; assume majority is vegetation (https://www.dnr.state.mn.us/birds/woodduck.html)
Bird	Herbivore	Wood Duck	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.05	kg diet item, ww/kg diet, ww	MN DNR (2020)	Consume acorns, weed seeds, berries, plants and insects; assume majority is vegetation (https://www.dnr.state.mn.us/birds/woodduck.html)
Bird	Herbivore	Wood Duck	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	MN DNR (2020)	Assumed not to be consumed based on reported diet contents.
Bird	Herbivore	Wood Duck	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww	MN DNR (2020)	Assumed not to be consumed based on reported diet contents.
Bird	Herbivore	Wood Duck	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	MN DNR (2020)	Assumed not to be consumed based on reported diet contents.
Bird	Herbivore	Wood Duck	P_{s}	Proportion of Diet - Sediment	0.24	kg sediment, dw/kg diet, dw	USEPA (1993)	Sediment ingestion in wood duck (USEPA, 1993).
Bird	Herbivore	Wood Duck	IR_{W}	Daily Water Ingestion	0.041	L water/day	USEPA (1993)	Mallard used as a surrogate; IR L/day= IR 0.058 (L/kg)*BW (kg)
Bird	Herbivore	Wood Duck	HR	Home Range	776	acres	CDFW (2021)	In Minnesota, breeding female wood ducks remained within 1 km (0.6 mi) of the nest during 70% of their time away (Gilmer et al. 1978, as cited in CDFW 2021); therefore, home range was calculated as area from nest using 1 km as radius.
Bird	Invertivore	Tree Swallow	BW	Body Weight	0.020	kg	Nagy (2001)	Measured value for tree swallow.
Bird	Invertivore	Tree Swallow	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.012	kg, dw/day	Nagy (2001)	Measured value for tree swallow (dry matter intake).
Bird	Invertivore	Tree Swallow	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.035	kg, ww/day	Nagy (2001)	Measured value for tree swallow (fresh matter intake).
Bird	Invertivore	Tree Swallow	P_{veg}	Proportion of Diet - Vegetation	0.17	kg diet item, ww/kg diet, ww	Beal (1918); USACHPPM (2004)	Estimated proportion of plant material.
Bird	Invertivore	Tree Swallow	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.26	kg diet item, ww/kg diet, ww	Beal (1918); USACHPPM (2004)	Estimated based on proportion of non-flying insects.
Bird	Invertivore	Tree Swallow	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.57	kg diet item, ww/kg diet, ww	Beal (1918); USACHPPM (2004)	Estimated based on proportion of flying (emergent aquatic) insects.
Bird	Invertivore	Tree Swallow	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	USACHPPM (2004)	Assumed not to be consumed.
Bird	Invertivore	Tree Swallow	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww	USACHPPM (2004)	Assumed not to be consumed.
Bird	Invertivore	Tree Swallow	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	USACHPPM (2004)	Assumed not to be consumed.
Bird	Invertivore	Tree Swallow	P_{s}	Proportion of Diet - Sediment	--	kg sediment, dw/kg diet, dw	Divine et al. (2020)	Assumed negligible based on feedng strategy.
Bird	Invertivore	Tree Swallow	IR_{W}	Daily Water Ingestion	0.0040	L water/day	USEPA (1993)	IR L/day= IR (L/kg)*BW (kg)
Bird	Invertivore	Tree Swallow	HR	Home Range	194	acres	Custer et al. (2019)	Tree swallows feed within approximately 0.5 km of their nest boxes (Stapleton and Robertson 2006, as cited in Custer et al. 2019); therefore, home range was calculated as area from nest using 0.5 km as radius.
Bird	Invertivore	Spotted sandpiper	BW	Body Weight	0.043	kg	USEPA (1993)	Average values reported for adult male and female spotted sandpipers (USEPA 1993).
Bird	Invertivore	Spotted sandpiper	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.0076	kg, dw/day	Nagy (2001)	Calculated using DW allometric equation for insectivore birds: FIR (dw) = 0.54 x BW ^ 0.705
Bird	Invertivore	Spotted sandpiper	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.0230	kg, ww/day	Nagy (2001)	Calculated using WW allometric equation for insectivore birds: FIR (ww) = 1.633 x BW ^ 0.705
Bird	Invertivore	Spotted sandpiper	P_{veg}	Proportion of Diet - Vegetation	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed.
Bird	Invertivore	Spotted sandpiper	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.80	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated based on USEPA (1993: Adult flying insects comprise the bulk of the diet; however, crustaceans, leeches, molluscs, small fish, and carrion also are eaten.
Bird	Invertivore	Spotted sandpiper	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.15	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated based on USEPA (1993: Adult flying insects comprise the bulk of the diet; however, crustaceans, leeches, molluscs, small fish, and carrion also are eaten.
Bird	Invertivore	Spotted sandpiper	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed based on reported diet contents.
Bird	Invertivore	Spotted sandpiper	P_{ff}	Proportion of Diet - Forage Fish	0.05	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed only to consume small fish.
Bird	Invertivore	Spotted sandpiper	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed.
Bird	Invertivore	Spotted sandpiper	P_{s}	Proportion of Diet - Sediment	0.073	kg sediment, dw/kg diet, dw	USEPA (1993)	Soil/sediment estimated in Least sandpiper diet (USEPA, 1993).
Bird	Invertivore	Spotted sandpiper	IR_{W}	Daily Water Ingestion	0.054	L water/day	USEPA (1993)	IR L/day= IR (L/kg)*BW (kg); Sandpiper used as surrogate
Bird	Invertivore	Spotted sandpiper	HR	Home Range	5.0	acres	CDFW (2021)	In New York, 3 individually marked breeding females fed and displayed over areas of 1.06,1.8, and 3.2 ha (2.5, 4.5 and 8.0 acres), with an average home range of 2.02 ha (5 acres) (Hays 1972, as cited in CDFW 2021).

Table 2. Information Sources for Wildlife Exposure Parameters
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Receptor Type	Feeding Guild	Species	Parameter	Definition	Value	Units	Reference	Notes
Bird	Piscivore	Great Blue Heron	BW	Body Weight	2.4	kg	USEPA (1993)	
Bird	Piscivore	Great Blue Heron	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.11	kg, dw/day	USEPA (1993)	Calculated from the ww-based FIR, assuming an 75% moisture content of food (i.e., 0.25 g, dw/g, ww).
Bird	Piscivore	Great Blue Heron	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.43	kg, ww/day	USEPA (1993)	FIR kg/day= WW FIR (kg/kg-day)*BW (kg) with FIR (kg/kg-day) of 0.18 from USEPA (1993)
Bird	Piscivore	Great Blue Heron	P_{veg}	Proportion of Diet - Vegetation	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents; consult additional literature for more information.
Bird	Piscivore	Great Blue Heron	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.15	kg diet item, ww/kg diet, ww	USEPA (1993)	Fish are the preferred prey, but great blues also eat amphibians, reptiles, crustaceans, insects, birds, and Mammals
Bird	Piscivore	Great Blue Heron	P_{ai}	Proportion of Diet - Aquatic Invertebrates	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents
Bird	Piscivore	Great Blue Heron	P_{am}	Proportion of Diet - Amphibians	0.05	kg diet item, ww/kg diet, ww	USEPA (1993)	Fish are the preferred prey, but great blues also eat amphibians, reptiles, crustaceans, insects, birds, and Mammals
Bird	Piscivore	Great Blue Heron	P_{ff}	Proportion of Diet - Forage Fish	0.80	kg diet item, ww/kg diet, ww	USEPA (1993)	Fish are the preferred prey, but great blues also eat amphibians, reptiles, crustaceans, insects, birds, and mammals
Bird	Piscivore	Great Blue Heron	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents; consult additional literature for more information.
Bird	Piscivore	Great Blue Heron	P_{s}	Proportion of Diet - Sediment	0.0040	kg sediment, dw/kg diet, dw	USEPA (1993)	Assumed to be approximately 20% of the value assumed for the Mallard, which was obtained from Table 4-4 in USEPA (1993)
Bird	Piscivore	Great Blue Heron	IR_{W}	Daily Water Ingestion	0.11	L water/day	USEPA (1993)	IR L/day= IR (L/kg)*BW (kg)
Bird	Piscivore	Great Blue Heron	HR	Home Range	11	acres	USEPA (1993)	Average of Fall and Winter homeranges
Bird	Piscivore	Bald Eagle	BW	Body Weight	4.15	kg	USEPA (1993)	Average of adult male and female bald eagles from Alaska and Florida.
Bird	Piscivore	Bald Eagle	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.12	kg, dw/day	USEPA (1993)	Calculated from the ww-based FIR, assuming an 75% moisture content of food (i.e., 0.25 g, dw/g, ww).
Bird	Piscivore	Bald Eagle	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.50	kg, ww/day	USEPA (1993)	FIR kg/day= WW FIR (kg/kg-day)*BW (kg) with FIR (kg/kg-day) of 0.12 (free-flying in Washington and Connecticut) from USEPA (1993)
Bird	Piscivore	Bald Eagle	P_{veg}	Proportion of Diet - Vegetation	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Bird	Piscivore	Bald Eagle	P_{bi}	Proportion of Diet - Benthic Invertebrates	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Bird	Piscivore	Bald Eagle	P_{ai}	Proportion of Diet - Aquatic Invertebrates	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Bird	Piscivore	Bald Eagle	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed based on reported diet contents.
Bird	Piscivore	Bald Eagle	P_{ff}	Proportion of Diet - Forage Fish	0.45	kg diet item, ww/kg diet, ww	USEPA (1993)	Based on forage fish (bullhead, sucker) percent occurance in pellets from Maine Inland River Habitat.
Bird	Piscivore	Bald Eagle	P_{pf}	Proportion of Diet - Predatory Fish	0.55	kg diet item, ww/kg diet, ww	USEPA (1993)	Based on predatory fish (pickerel, bass, perch) and 'other fish' percent occurance in pellets from Maine Inland River Habitat, as well as conservatively assuming the percetn occurances from birds and mammals.
Bird	Piscivore	Bald Eagle	P_{s}	Proportion of Diet - Sediment	--	kg sediment, dw/kg diet, dw		Assumed negligible based on feedng strategy.
Bird	Piscivore	Bald Eagle	IR_{W}	Daily Water Ingestion	0.15	L water/day	USEPA (1993)	IR L/day= IR 0.036 (L/kg)*BW (kg)
Bird	Piscivore	Bald Eagle	HR	Home Range	4646	acres	USEPA (1993)	Mean Winter home range of adults (both sexes) in Missouri lake habitat.
Mammal	Herbivore	Muskrat	BW	Body Weight	1.6	kg	MN DNR (2020)	Average of all adult body weights in MN (https://www.dnr.state.mn.us/Mammals/muskrat.html)
Mammal	Herbivore	Muskrat	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.14	kg, dw/day	USEPA (1993)	Calculated from the ww-based FIR, assuming an 75% moisture content of food (i.e., 0.25 g, dw/g, ww).
Mammal	Herbivore	Muskrat	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.54	kg, ww/day	USEPA (1993)	FIR kg/day= WW FIR (kg/kg-day)*BW (kg) with FIR (kg/kg-day) of 0.34 from USEPA (1993)
Mammal	Herbivore	Muskrat	P_{veg}	Proportion of Diet - Vegetation	0.80	kg diet item, ww/kg diet, ww	USEPA (1993)	Primarily herbivorous.
Mammal	Herbivore	Muskrat	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.10	kg diet item, ww/kg diet, ww	USEPA (1993)	Primarily herbivorous.
Mammal	Herbivore	Muskrat	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.10	kg diet item, ww/kg diet, ww	USEPA (1993)	Primarily herbivorous.
Mammal	Herbivore	Muskrat	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Mammal	Herbivore	Muskrat	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Mammal	Herbivore	Muskrat	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww		Assumed not to be consumed based on reported diet contents.
Mammal	Herbivore	Muskrat	P_{s}	Proportion of Diet - Sediment	0.020	kg sediment, dw/kg diet, dw	USEPA (1993)	Meadow Vole used as a surrogate
Mammal	Herbivore	Muskrat	IR_{W}	Daily Water Ingestion	0.88	L water/day	USEPA (1993)	Max reported; IR L/day= IR (L/kg)*BW (kg)
Mammal	Herbivore	Muskrat	HR	Home Range	0.32	acres	USEPA (1993)	Average HR reported (0.13 ha) converted to acres.

PFAS Abbreviations:
FASAA - perrfluoroalkane sulfonamido acetic acids
FASE - perfluoroalkane sulfonamido ethanols
FOSA - perfluorooctane sulfonamides
N-EtFOSAA - N-Ethylperfluorooctane sulfonamidoacetic acid
N-MeFOSAA - N-Methylperfluorooctane sulfonamidoacetic acid
PFAS - Per- and polyfluoroalkyl substances
PFBA - Perfluorobutanoic acid
PFCA - Perfluoroalkyl carboxylic acids
PFDA - Perfluorodecanoic acid
PFDoA - Perfluorododecanoic acid
PFDS - Perfluorodecane sulfonic acid
PFHpA - Perfluoroheptanoic acid

PFAS Abbreviations Cont.:
PFHpS - Perfluoroheptane sulfonic acid
6:2 FTS - 6:2 Fluorotelomer sulfonic acid
PFHxS - Perfluorohexanesulfonic acid
PFNA - Perfluorononanoic acid
PFNS - Perfluoroonoane sulfonic acid
PFOA - Perfluorooctanoic acid
PFOS - Perfluorooctanesulfonic acid
PFOSA - Perfluorooctane sulfonamide
PFSA- perfluoroalkane sulfonic acids
PFTeDA - Perfluorotetradecanoic acid
PFTrDA - Perfluorotridecanoic acid
PFUnA - Perfluoroundecanoic acid

Addditional Abbreviations:
BAF - Bioaccumulation Factor
dw - dry weight
kg - kilogram
L - liter
ww - wet weight

Notes:
a: Converted to ww tissue using 85.5% moisture content (average of algae [84%] and aquatic macrophytes [87%]; Table 4-2 EPA 1993)
b: Converted to ww tissue using 82% moisture content (bivalves (without shell); Table 4-1 EPA 1993)
c: Aquatic/Benthic Invert Values are based on filter-feeding benthic invertebrates (oyster, mussel, gastropod, snail, other bivalves) and were selected to represent aquatic invertebrates (including aerial insects) exposed to PFAS in water. Filter-feeding benthic invertebrates are expected to have exposure to contaminants in the water column similar to other aquatic
d: See Appendix E for BAFs derived using Project 1007 tissue and surface water data.

Notes:
EPCs were selected as the lower of the selected UCL and maximum detected concentration (see Appendix D)
Site-specific empirical data were selected over modeled values when available:
- Benthic invertebrates = not collected
- Amphibians = not collected
- Forage fish = black crappie, bluegill, and cisco
- Predatory fish = largemouth bass and northern pike

When empirical data were lacking, tissue EPCs were calculated by multiplying the surface water EPC by the analyte- and tissue-specific bioaccumulation parameter (see Table 3).

Additional Abbreviations:
See Table 3 for PFAS abbreviations
µg - micrograms
dw - dry weight
EPC - exposure point concentration
kg - kilogram
L - liters
NA - not available
NC - not calculated
ND - not detected
UCL - upper confidence limit of the arithmetic mean
ww - wet weight

Appendix J Food Web Model – Lake Elmo
Table 7. Potential Risks to the Wood Duck
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Site: Lake Elmo	
Assumptions for the Wood Duck	
Body Weight (kg)	0.70
Seasonal Use Factor	1
Site-Specific Area Use Factor	0.37
Sediment Ingestion Rate (kg_{dw}/day)	0.0098
Water Ingestion Rate (kg/day)	0.041
Benthic Invert. Ingestion Rate (kg_{ww}/day)	0.0064
Aquatic Invert. Ingestion Rate (kg_{ww}/day)	0.0064
Plant Ingestion Rate (kg_{ww}/day)	0.11

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w]) \times SUF \times AUF}{\text{Body Weight}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment (kg/day)
IR_w = Ingestion rate of water (L/day)
C_f = Concentration of PFAS in food (ug/kg)
C_s= Concentration of PFAS in sediment (ug/kg)
C_w = Concentration of PFAS in water (ug/L)
SUF = Seasonal Use Factor (fraction of time receptor spends within exposure area)

SUPPORTING CALCULATIONS

Notes:
HQs above 1 are bolded and highlighted.

Abbreviations:
See Table 3 for PFAS abbreviations
µg - microgram
UCL - upper confidence limit of the arithmetic mean
BW - body weight
dw - dry weight
EPC - exposure point concentration
HQ - hazard quotient (Dose/TRV)
kg - kilogram
L - liter
LOAEL - lowest observed adverse effects level
NC - not calculated
ND - not detected
NOAEL - no observed adverse effects level
TRV - toxicity reference value
ww - wet weight

Appendix J Food Web Model – Lake Elmo
Table 8. Potential Risks to the Tree Swallow
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Site: Lake Elmo	
Assumptions for the Tree Swallow	
Body Weight (kg)	0.02
Seasonal Use Factor	1
Site-Specific Area Use Factor	1
Water Ingestion Rate (kg/day)	0.0040
Benthic Invert. Ingestion Rate (kg_{ww}/day)	0.0092
Aquatic Invert. Ingestion Rate (kg_{ww}/day)	0.020
Plant Ingestion Rate (kg_{ww}/day)	0.0060

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_w \times C_w]) \times SUF \times AUF}{\text{Body Weight}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_w = Ingestion rate of water (L/day)
C_f = Concentration of PFAS in food (ug/kg)
C_w = Concentration of PFAS in water (ug/L)
SUF = Seasonal Use Factor (fraction of time receptor spends within exposure area)

SUPPORTING CALCULATIONS

Notes:
HQs above 1 are bolded and highlighted.

Abbreviations:
See Table 3 for PFAS abbreviations
µg - microgram
UCL - upper confidence limit of the arithmetic mean
BW - body weight
dw - dry weight
EPC - exposure point concentration
HQ - hazard quotient (Dose/TRV)
kg - kilogram
L - liter
LOAEL - lowest observed adverse effects level
NC - not calculated
ND - not detected
NOAEL - no observed adverse effects level
TRV - toxicity reference value
ww - wet weight

Appendix J Food Web Model – Lake Elmo
Table 15. Potential Risks to the River Otter
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Site: Lake Elmo	
Assumptions for the River Otter	
Body Weight (kg)	7.7
Seasonal Use Factor	1
Site-Specific Area Use Factor	0.10
Water Ingestion Rate (kg/day)	0.41
Benthic Invert. Ingestion Rate (kg_{ww}/day)	0.12
Amphibian Ingestion Rate (kg_{ww}/day)	0.039
Forage Fish Ingestion Rate (kg_{ww}/day)	0.27
Predatory Fish Ingestion Rate (kg_{ww}/day)	0.35

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_w \times C_w]) \times SUF \times AUF}{\text{Body Weight}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_w = Ingestion rate of water (L/day)
C_f = Concentration of PFAS in food (ug/kg)
C_w = Concentration of PFAS in water (ug/L)
SUF = Seasonal Use Factor (fraction of time receptor spends within exposure area)

SUPPORTING CALCULATIONS

Analyte	Media Concentrations					Potential Daily Dose (ug/kg_{bw}/day)						NOAEL-based TRV (ug/kg_{bw}/day)	NOAEL-based HQ	LOAEL-based TRV (ug/kg_{bw}/day)	LOAEL-based HQ

Notes:
References for all species-specific exposure factors are provided in Table 2.
1 - Dry weight food ingestion rate (FIR) is applied to concentrations of PFAS in sediment, generally reported on dry weight basis.
2 - Wet weight FIR is applied to tissue data, generally reported on fresh or wet weight basis.
3 - AUF values for receptors were calculated by dividing the size of the exposure area by the home range. If the home range is smaller than the exposure area, an AUF of 1 was used. Site Use Factor (SUF) of 1 was selected for all receptors.
4 - Dietary ingestion rates were calculated by multiplying the receptor- and tissue-specific proportion of diet by the receptor-specific FIR_{ww}.
5 - IR_S were calculated by multiplying the receptor-specific P_S by the receptor-specific FIR_{dw}.
6 - IR_W is reported in L/day or kg/day because 1 L of water has weight of 1 kg
7 - Proportion of diet was modified to include predatory fish, which were collected from WLA. Forage and predatory fish proportions consistent with Eagle Point Lake and Lake Elmo.

Abbreviations:
dw - dry weight
kg - kilogram
L - liters
WLA - West Lakeland Area
ww - wet weight

Exposure Areas (Acres):
WLA = 116

Receptor Type	Feeding Guild	Species	Parameter	Definition	Value	Units	Reference	Notes
Bird	Herbivore	Wood Duck	BW	Body Weight	0.70	kg	NC WRC (2019)	Lowest reported body weight (converted to kg)
Bird	Herbivore	Wood Duck	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.041	kg, dw/day	Nagy (2001)	Calculated using DW allometric equation for omnivorous birds: FIR (dw) = 0.67 x BW ^ 0.627
Bird	Herbivore	Wood Duck	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.13	kg, ww/day	Nagy (2001)	Calculated using WW allometric equation for omnivorous birds: FIR (ww) = 2.094 x BW ^ 0.627
Bird	Herbivore	Wood Duck	P_{veg}	Proportion of Diet - Vegetation	0.90	kg diet item, ww/kg diet, ww	MN DNR (2020)	Consume acorns, weed seeds, berries, plants and insects; assume majority is vegetation (https://www.dnr.state.mn.us/birds/woodduck.html)
Bird	Herbivore	Wood Duck	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.05	kg diet item, ww/kg diet, ww	MN DNR (2020)	Consume acorns, weed seeds, berries, plants and insects; assume majority is vegetation (https://www.dnr.state.mn.us/birds/woodduck.html)
Bird	Herbivore	Wood Duck	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.05	kg diet item, ww/kg diet, ww	MN DNR (2020)	Consume acorns, weed seeds, berries, plants and insects; assume majority is vegetation (https://www.dnr.state.mn.us/birds/woodduck.html)
Bird	Herbivore	Wood Duck	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	MN DNR (2020)	Assumed not to be consumed based on reported diet contents.
Bird	Herbivore	Wood Duck	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww	MN DNR (2020)	Assumed not to be consumed based on reported diet contents.
Bird	Herbivore	Wood Duck	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	MN DNR (2020)	Assumed not to be consumed based on reported diet contents.
Bird	Herbivore	Wood Duck	P_{s}	Proportion of Diet - Sediment	0.24	kg sediment, dw/kg diet, dw	USEPA (1993)	Sediment ingestion in wood duck (USEPA, 1993).
Bird	Herbivore	Wood Duck	IR_{W}	Daily Water Ingestion	0.041	L water/day	USEPA (1993)	Mallard used as a surrogate; IR L/day= IR 0.058 (L/kg)*BW (kg)
Bird	Herbivore	Wood Duck	HR	Home Range	776	acres	CDFW (2021)	In Minnesota, breeding female wood ducks remained within 1 km (0.6 mi) of the nest during 70% of their time away (Gilmer et al. 1978, as cited in CDFW 2021); therefore, home range was calculated as area from nest using 1 km as radius.
Bird	Invertivore	Tree Swallow	BW	Body Weight	0.020	kg	Nagy (2001)	Measured value for tree swallow.
Bird	Invertivore	Tree Swallow	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.012	kg, dw/day	Nagy (2001)	Measured value for tree swallow (dry matter intake).
Bird	Invertivore	Tree Swallow	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.035	kg, ww/day	Nagy (2001)	Measured value for tree swallow (fresh matter intake).
Bird	Invertivore	Tree Swallow	P_{veg}	Proportion of Diet - Vegetation	0.17	kg diet item, ww/kg diet, ww	Beal (1918); USACHPPM (2004)	Estimated proportion of plant material.
Bird	Invertivore	Tree Swallow	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.26	kg diet item, ww/kg diet, ww	Beal (1918); USACHPPM (2004)	Estimated based on proportion of non-flying insects.
Bird	Invertivore	Tree Swallow	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.57	kg diet item, ww/kg diet, ww	Beal (1918); USACHPPM (2004)	Estimated based on proportion of flying (emergent aquatic) insects.
Bird	Invertivore	Tree Swallow	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	USACHPPM (2004)	Assumed not to be consumed.
Bird	Invertivore	Tree Swallow	P_{ff}	Proportion of Diet - Forage Fish	--	kg diet item, ww/kg diet, ww	USACHPPM (2004)	Assumed not to be consumed.
Bird	Invertivore	Tree Swallow	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	USACHPPM (2004)	Assumed not to be consumed.
Bird	Invertivore	Tree Swallow	P_{s}	Proportion of Diet - Sediment	--	kg sediment, dw/kg diet, dw	Divine et al. (2020)	Assumed negligible based on feedng strategy.
Bird	Invertivore	Tree Swallow	IR_{W}	Daily Water Ingestion	0.0040	L water/day	USEPA (1993)	IR L/day= IR (L/kg)*BW (kg)
Bird	Invertivore	Tree Swallow	HR	Home Range	194	acres	Custer et al. (2019)	Tree swallows feed within approximately 0.5 km of their nest boxes (Stapleton and Robertson 2006, as cited in Custer et al. 2019); therefore, home range was calculated as area from nest using 0.5 km as radius.
Bird	Invertivore	Spotted sandpiper	BW	Body Weight	0.043	kg	USEPA (1993)	Average values reported for adult male and female spotted sandpipers (USEPA 1993).
Bird	Invertivore	Spotted sandpiper	FIR_{dw}	Daily Food Ingestion Rate (dry matter)	0.0076	kg, dw/day	Nagy (2001)	Calculated using DW allometric equation for insectivore birds: FIR (dw) = 0.54 x BW ^ 0.705
Bird	Invertivore	Spotted sandpiper	FIR_{ww}	Daily Food Ingestion Rate (wet matter)	0.0230	kg, ww/day	Nagy (2001)	Calculated using WW allometric equation for insectivore birds: FIR (ww) = 1.633 x BW ^ 0.705
Bird	Invertivore	Spotted sandpiper	P_{veg}	Proportion of Diet - Vegetation	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed.
Bird	Invertivore	Spotted sandpiper	P_{bi}	Proportion of Diet - Benthic Invertebrates	0.80	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated based on USEPA (1993: Adult flying insects comprise the bulk of the diet; however, crustaceans, leeches, molluscs, small fish, and carrion also are eaten.
Bird	Invertivore	Spotted sandpiper	P_{ai}	Proportion of Diet - Aquatic Invertebrates	0.15	kg diet item, ww/kg diet, ww	USEPA (1993)	Estimated based on USEPA (1993: Adult flying insects comprise the bulk of the diet; however, crustaceans, leeches, molluscs, small fish, and carrion also are eaten.
Bird	Invertivore	Spotted sandpiper	P_{am}	Proportion of Diet - Amphibians	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed based on reported diet contents.
Bird	Invertivore	Spotted sandpiper	P_{ff}	Proportion of Diet - Forage Fish	0.05	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed only to consume small fish.
Bird	Invertivore	Spotted sandpiper	P_{pf}	Proportion of Diet - Predatory Fish	--	kg diet item, ww/kg diet, ww	USEPA (1993)	Assumed not to be consumed.
Bird	Invertivore	Spotted sandpiper	P_{s}	Proportion of Diet - Sediment	0.073	kg sediment, dw/kg diet, dw	USEPA (1993)	Soil/sediment estimated in Least sandpiper diet (USEPA, 1993).
Bird	Invertivore	Spotted sandpiper	IR_{W}	Daily Water Ingestion	0.054	L water/day	USEPA (1993)	IR L/day= IR (L/kg)*BW (kg); Sandpiper used as surrogate
Bird	Invertivore	Spotted sandpiper	HR	Home Range	5.0	acres	CDFW (2021)	In New York, 3 individually marked breeding females fed and displayed over areas of 1.06,1.8, and 3.2 ha (2.5, 4.5 and 8.0 acres), with an average home range of 2.02 ha (5 acres) (Hays 1972, as cited in CDFW 2021).

ADONA	228	33.1	Surrogate - PFOA		1327	239	Surrogate - PFHxS	
NFDHA	19	2.8	Surrogate - PFBA		298	54	Surrogate - PFBS	

PFAS Abbreviations:
FASAA - perrfluoroalkane sulfonamido acetic acids
FASE - perfluoroalkane sulfonamido ethanols
FOSA - perfluorooctane sulfonamides
N-EtFOSAA - N-Ethylperfluorooctane sulfonamidoacetic acid
N-EtFOSE - N-Ethyl perfluoroctane sulfonamido ethanol
NFDHA - Nonafluoro-3,6-dioxaheptanoic acid
N-MeFOSAA - N-Methylperfluorooctane sulfonamidoacetic acid
PFBA - Perfluorobutanoic acid
PFCA - Perfluoroalkyl carboxylic acids
PFDA - Perfluorodecanoic acid
PFDoA - Perfluorododecanoic acid
PFDS - Perfluorodecane sulfonic acid
PFHpA - Perfluoroheptanoic acid

PFAS Abbreviations Cont.:
PFHpS - Perfluoroheptane sulfonic acid
PFHxA - Perfluorohexanoic acid
PFHxS - Perfluorohexanesulfonic acid
PFNA - Perfluorononanoic acid
PFNS - Perfluoroonoane sulfonic acid
PFOA - Perfluorooctanoic acid
PFOS - Perfluorooctanesulfonic acid
PFOSA - Perfluorooctane sulfonamide
PFSA- perfluoroalkane sulfonic acids
PFTeDA - Perfluorotetradecanoic acid
PFTrDA - Perfluorotridecanoic acid
PFUnA - Perfluoroundecanoic acid
6:2 FTS - 6:2 Fluorotelomer sulfonic acid

Addditional Abbreviations:
BAF - Bioaccumulation Factor
dw - dry weight
kg - kilogram
L - liter
ww - wet weight

a - Converted to ww tissue using 85.5% moisture content (average of algae [84%] and aquatic macrophytes [87%]; Table 4-2 EPA 1993)
b - Aquatic/Benthic Invert Values are based on filter-feeding benthic invertebrates (oyster, mussel, gastropod, snail, other bivalves) and were selected to represent aquatic invertebrates (including aerial insects) exposed to PFAS in water. Filter-feeding benthic invertebrates are expected to have exposure to
c - Converted to ww tissue using 82% moisture content (bivalves (without shell); Table 4-1 EPA 1993)

Notes:
TRVs were selected from the following hierarchy due to preference for EcoSSL TRV-derivation approach (USEPA 2005) and that Zodrow et al. (2020) has been peer reviewed:

1. Divine et al. (2020) and/or Zodrow et al. (2020)
2. Condor et al. (2020)

Abbreviations:
See Table 3 for PFAS abbreviations
µg/kg-day - micrograms per kilogram body weight per day
EcoSSL - Ecological Soil Screening Level
LOAEL - lowest observed adverse effects level
NOAEL - no observed adverse effects level
TRV - toxicity reference value
USEPA - United States Environmental Protection Agency

Notes:
EPCs were selected as the lower of the selected UCL and maximum detected concentration (see Appendix D)
Site-specific empirical data were selected over modeled values when available:
- Benthic invertebrates = crayfish
- Amphibians = green frogs and tadpoles
- Forage fish = bluegill and green sunfish
- Predatory fish = largemouth bass

When empirical data were lacking, tissue EPCs were calculated by multiplying the surface water EPC by the analyte- and tissue-specific bioacummulation parameter (see Table 3).

Additional Abbreviations:
See Table 3 for PFAS abbreviations
µg - micrograms
dw - dry weight
EPC - exposure point concentration
kg - kilogram
L - liters
NA - not available
NC - not calculated
ND - not detected
UCL - upper confidence limit of the arithmetic mean
ww - wet weight

Appendix K Food Web Model – West Lakeland Area
Table 7. Potential Risks to the Wood Duck
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Site: West Lakeland Area	
Assumptions for the Wood Duck	
Body Weight (kg)	0.70
Seasonal Use Factor	1
Site-Specific Area Use Factor	0.15
Sediment Ingestion Rate (kg_{dw}/day)	0.0098
Water Ingestion Rate (kg/day)	0.041
Benthic Invert. Ingestion Rate (kg_{ww}/day)	0.0064
Aquatic Invert. Ingestion Rate (kg_{ww}/day)	0.0064
Plant Ingestion Rate (kg_{ww}/day)	0.11

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w]) \times SUF \times AUF}{\text{Body Weight}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment (kg/day)
IR_w = Ingestion rate of water (L/day)
C_f = Concentration of PFAS in food (ug/kg)
C_s = Concentration of PFAS in sediment (ug/kg)
C_w = Concentration of PFAS in water (ug/L)
SUF = Seasonal Use Factor (fraction of time receptor spends within exposure area)

SUPPORTING CALCULATIONS

L - liter
LOAEL - lowest observed adverse effects level
NC - not calculated
ND - not detected
NOAEL - no observed adverse effects level
TRV - toxicity reference value
UCL - upper confidence limit of the arithmetic mean
ww - wet weight

Appendix K Food Web Model – West Lakeland Area
Table 13. Potential Risks to the Mink
Ecological Risk Assessment Food Web Model
Project 1007
Minneapolis, Minnesota

Site: West Lakeland Area	
Assumptions for the Mink	
Body Weight (kg)	1.4
Seasonal Use Factor	1
Site-Specific Area Use Factor	1.0
Sediment Ingestion Rate (kg_{dw}/day)	0.0016
Water Ingestion Rate (kg/day)	0.055
Benthic Invert. Ingestion Rate (kg_{ww}/day)	0.022
Aquatic Invert. Ingestion Rate (kg_{ww}/day)	0.022
Plant Ingestion Rate (kg_{ww}/day)	0.011
Amphibian Ingestion Rate (kg_{ww}/day)	0.011
Forage Fish Ingestion Rate (kg_{ww}/day)	4.4E-02
Predatory Fish Ingestion Rate (kg_{ww}/day)	1.1E-01

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w]) \times SUF \times AUF}{\text{Body Weight}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment (kg/day)
IR_w = Ingestion rate of water (L/day)
C_f = Concentration of PFAS in food (ug/kg)
C_s= Concentration of PFAS in sediment (ug/kg)
C_w = Concentration of PFAS in water (ug/L)
SUF = Seasonal Use Factor (fraction of time receptor spends within exposure area)

Notes:
HQs above 1 are bolded and highlighted.

Abbreviations:
See Table 3 for PFAS abbreviations
µg - microgram
BW - body weight
dw - dry weight
EPC - exposure point concentration
HQ - hazard quotient (Dose/TRV)
kg - kilogram
L - liter
LOAEL - lowest observed adverse effects level
NC - not calculated
ND - not detected
NOAEL - no observed adverse effects level
TRV - toxicity reference value
UCL - upper confidence limit of the arithmetic mean
ww - wet weight
